2	African markets: tailwinds coming up
21	Angola: bold reforms bearing results
27	Botswana: fiscal policy filches from growth
33	Côte d'Ivoire: election year likely to lead to slower growth
39	DRC: growth outlook dims
45	Egypt: entrenched post-IMF revival
51	Ethiopia: IMF programme reinforces optimism
57	Ghana: election year influences in store
63	Kenya: 2020 looks promising
69	Malawi: political risks clouding the outlook
75	Mauritius: fiscal consolidation after election spending
81	Morocco: restrained by external conditions
87	Mozambique: peace, agriculture – root of inclusive growth
93	Namibia: an economy in recovery
99	Nigeria: steady as she goes
105	Rwanda: growth remaining robust
111	Senegal: gearing up for the oil production race
117	Tanzania: public investment still supporting growth
123	Tunisia: tourism to lead a slow recovery
129	Uganda: oil investment should boost FDI
135	Zambia: likely trough the only silver lining
141	Glossary

## Tailwinds coming up

- Over the past 12-15 months, the global backdrop increasingly posed a headwind to the economic growth outlook for Africa. Uncertainty triggered by the US-China trade war, the removal of monetary policy support in some developed countries, together with outright tightening of monetary policy in others, prompted downward revisions to consensus forecasts for global growth in 2020 and 2021. However, we believe that global growth forecasts for 2020 and perhaps 2021, which already indicate acceleration from 2019, will be revised upwards. We expect elevated global financial markets and growth in developed economies to boost economic growth in Africa.
- There has been much hype about the proposed changes to the XOF. We now propose some questions and answers: Is the chance of devaluation for the reformed XOF greater or less than the previous arrangement? Greater. Are there hedging instruments that one could use to manage this risk? Yes. How can one know if there is anything that will change operationally for businesses operating in the region because of the reform? From regulatory pronouncements made by the Banque Centrale des Etats de l'Afrique de l'Ouest (BCEAO).
- In formulating views about the evolution of the commodity producing economies in our coverage, it seems reasonable to assume that oil prices will range mostly around USD60/bbl – USD65/bbl in 2020. For copper prices, a range of USD6,200/MT – USD6,500/MT seems reasonable. Sure, over the course of the year there might be a fair bit of volatility, perhaps occasioned by trade anxiety or a flare-up of geopolitical noise. But it seems unlikely that prices will deviate much from their recent ranges.
- Risk assets have rallied tremendously since 2009, with some commentators now observing market frothiness. Yet others suggest that the US equity market rally specifically is the 'most unloved' in history. Evidently, the rally has benefited only a small section of the investing public, with large amounts of cash sitting on the sidelines. While a correction might be underway, with the scare due to the coronavirus outbreak weighing on market sentiment, it is hard to say that the rally is ending.
- We still see the Eurobond market continuing to rally in the next 2 – 3 months. We like Egypt and Senegal and we retain our tactical overweight exposure to Angola and Nigeria.
- In local rates markets, the Ugandan duration trade probably needs re-evaluation. We still like the trade but expect some transitory pressure against the trade between Q2:20 and Q3:20. Given how much the other positions in our shadow portfolio have rallied, such as the KES, NGN and EGP, we are more inclined to take profits in coming months. Implied NDF yields are too low across the board, except on the USD/ZMW, but the pressure on the ZMW seems set to persist.

### Global growth – turning into a tailwind for Africa

Developed countries' GDP growth is widely expected to slow in 2020. But, that has been the case for at least a year already. Moreover, forecast revisions have tended to the downside.

The slowdown among developed countries was not the only reason economic growth in Africa failed to meet our expectations but it admittedly was a significant factor. There was drought that affected agricultural production in some countries in Southern Africa. In Zambia and Zimbabwe, the severity of the drought also constrained hydro-electricity generation.

Clearly, the US-China trade war had an impact on the trajectory of copper prices, thereby affecting Zambian economic activity. Now that there is a US/China truce of sorts, an uptick in commodity prices that might turn out positively for copper production seems possible.

Significant policy missteps in some countries may explain their persistent economic underperformance. Policymakers in these countries probably need to redouble their efforts to boost investment spending and address infrastructural bottlenecks. To attract capital for such investment spending, these governments would find the going easier if global financial market sentiment remained elevated.

Even though most forecasters have been downwardly revising their forecasts for global GDP growth in both 2019 and 2020, these forecasts still point to acceleration in both years. Moreover, we are now probably close to the bottom of these revisions. From now on, we'd foresee 2020 revisions as upwards. This is true of both African economies and developed market economies. Ebullient global financial markets and faster growth in developed economies should therefore support economic growth in Africa.

### **African currency unions – much hype, little impact**

It would seem every time that some regional trading block on the continent makes a pronouncement about possibly adopting a common currency, new fresh insights on the topic of regional currencies arise.

It is worth pointing out that the East African Community (EAC), the Southern African Development Community (SADC) and the Economic Community of West African States (ECOWAS) have all, at some point or other, made a commitment to adopting a single currency by some stipulated deadline. Since 2000, all these trading blocks have made such commitments, then changed them, and recommitted to new dates.

Besides these postponements is the flurry of speculation and conjecture that such pronouncements provoke each time. But, when nothing changes, ordinary lives resume, only for the flurry of speculation to be revived when another block makes a pronouncement.

This is not to say that these regional trading blocks won't ever promulgate common currencies. But one should separate regulatory pronouncements from political bluster. If a common currency is to be adopted in a region, then the central banks in that region would develop regulations and guidelines to effect the creation of such a common currency. Similarly, regulators for other business sectors, like pension funds, would also issue regulations affecting those industries. Once those have been communicated, compliance with them would be mandatory for all citizens of the countries in that trading block. Everything else would amount to speculation based on what may turn out mere political bluster.

So, for citizens in a trading block that is purportedly going to introduce a common currency, it is far more instructive to keep track and comply with the applicable regulations in that trading block.

One doesn't need to know the date that the SADC or the EAC has committed to adopting a common currency. When that date approaches, there will be increased hype about it. But, considering that various pronouncements have been made over the last 20-y, is there any reasonable basis for one to determine if the current currency arrangements will be any different in another 5-y? Probably not. But it is perhaps a reasonable starting point to say that the probability of the status quo being maintained is closer to 100% than to 0%. Is there a way of telling if such a change, were it to happen, would be deleterious, and if so, an acceptable way of mitigating the risks now? Also probably not.

It is always worth keeping in mind that the establishment of a common currency would be the result of a political process, a potentially long and tortuous process.

Specifically, for investors in the XOF region, the question boils down to whether a new regime there would imply a greater chance of depreciation than has transpired since

1994 when the CFA franc was last devalued. If one follows our logic from above, then the probability that the GHS and NGN will still be around in 5-y is close to 100%.

But members of the Union Economique et Monétaire Ouest-Africaine (UEMOA) that use the XOF have taken decisions that will reform that arrangement. There will no longer be French representatives in the governance structures for the XOF. The region’s FX reserves will be managed by the Banque Centrale des Etats de l’Afrique de l’Ouest (BCEAO) rather than having half of them pledged to the French Treasury. However, the latter would still guarantee convertibility of the XOF.

Notably, these changes are meant as preparation for the adoption of the ECO as a single currency for ECOWAS, which is made up of UEMOA and the West African Monetary Zone (WAMZ). Crucially, members of the WAMZ have their own currencies. Nigeria has a GDP that is about 40% of ECOWAS. Presumably, adoption of a single currency would not be a replication of the XOF mechanism for the entire ECOWAS.

After all, it is worth pointing out that the CFA franc mechanism is a combination of a monetary union and a currency peg. This removes policy flexibility for individual members in a monetary union. For example, they lose the ability to manage monetary policy, as such authority would be housed in a regional central bank, as is the case for UEMOA. There would be restrictions on fiscal policy conduct. Lastly, policymakers must commit to entrenching a policy framework that relies on gaining external competitiveness via productivity improvements rather than currency devaluation.

There is a lot that is uncertain at present, not least of which is for which currency regime ECOWAS will ultimately settle. Is the ECO going to be pegged, a managed float, or free-floating? Perhaps members of the WAMZ value policy flexibility more than those in UEMOA. In that case, the ECO arrangement would be less restrictive than the XOF arrangement.

It seems reasonable to believe that if ECOWAS will ultimately adopt the ECO as a common currency, it would have a greater chance of depreciating than the XOF. But, right now, there is probably nothing worth doing to prepare for such a change. Of course, there is no way of knowing when the ECO will start being used in actual transactions. The bottom line is that despite all the hype about the ECO in West Africa, as a practical matter, there is probably no cost to operating as if the status quo will prevail for the next 5-y.

### Commodity prices: inching higher

**Figure 1: Commodity prices have an upside bias**

Source: Bloomberg

It seems likely that commodity prices will rise in the next 4-m. For much of H2:19, commodity prices were bottoming out, especially base metals prices. Copper prices hovered around the USD6,000/MT level in late-2018. The recovery in early 2019 was cut short once prices got around USD6,500/MT in early 2019, and reverted to just below USD6,000/MT for much of H2:19.

Such downward pressure was understandable given the mounting anxiety about the global growth outlook precipitated by the US-China trade conflict. Consensus forecasts for copper prices were consistently revised lower in 2019. Yet, these have been revised higher since Dec, with consensus forecasts putting copper prices at USD6,200/MT at the end of this year, up USD450/MT from the forecast at the end of Dec.

We wouldn't be surprised to see these forecasts nudged higher this year. The theme of supply constraints keeps coming up among copper analysts. There has been occasional, isolated speculation that copper prices could rise above USD7,000/MT, although, clearly, that is not the consensus view. Be that as it may, it seems as if the risks are biased to the upside despite any volatility occasioned by geopolitical or trade shocks.

This was not limited to copper prices. The London Metals Exchange's LME index bobbed around the 2,800 level for much of H2:19, with the upside capped at about 2,860. It has been nudging this level since end 2019.

There is still plenty to suggest that oil prices will remain mostly above USD60.0/bbl over the next 4 – 6 months. Geopolitical strains, especially surrounding Iran, could keep prices elevated. Additionally, OPEC seems prepared to stick with production quotas to keep prices elevated.

Consensus forecasts for oil prices drifted marginally lower in Q4:19, with forecasts for the Brent crude oil price at the end of 2020 approaching USD60/bbl. But these are inching higher. For our macroeconomic forecasting purposes, we have assumed prices will be around USD60/bbl – USD65/bbl this year.

**Global risk appetite: further rally in risk assets still likely**

Since publication of the Sep edition of this report, the S&P 500 Volatility index has been mostly below 15, falling closer to the 12 level at the time of writing. It jumped to just over 20 temporarily in early Oct, but the trend has been to the downside.

**Figure 2: Volatility subdued**

Source: Bloomberg; Standard Bank Research

Perhaps this is to be expected given that the US equity markets have been consistently rallying, making record highs over the past 3-m.

By some accounts, the performance of the US equity markets seems the embodiment of market frothiness inspired by loose monetary policy. This characterisation could apply to all risk assets, since most returned around 20% in 2019, as the table on page 2 shows. Indeed, the strong US equity market performance was replicated by other developed market equities, romping ahead of their emerging market counterparts.

Yet other accounts characterise this rally as being the most unloved, with considerable amounts of cash sitting on the side-lines as some investors fret over risks that might derail this rally that has now broken all kinds of records. There are other indicators that point to plenty of anxiety in the market despite the low levels of the VIX index. Lately, the outbreak of the coronavirus is causing jitters in the markets. Bellicose trade rhetoric from the US administration may agitate markets over the next 4 – 6 months. However, electoral aspirations may influence the US president’s approach to trade. Arguably, there is little to be gained by the US president in starting another skirmish that might undermine sentiment and slow the real economy. With the re-negotiated NAFTA and the phase 1 of the China trade pact under his belt, he has plenty to bask in.

**Global rates: sustained monetary stimulus**

Even though the US Federal Reserve’s Federal Open Market Committee has been hinting at keeping the Fed Funds rate steady for a prolonged period, the market is still expecting another rate cut. Still, these expectations are for H2:20 rather than H1:20. Consensus forecasts for the Fed Funds rate at the end of Q4:20 have now drifted marginally higher in the past 2 – 3 weeks. Even market pricing for the Fed Funds rate suggests that conviction in the rate cut view has been waning. Perhaps if economic data keeps up a strong showing, the consensus forecasts will gravitate towards a no rate cut view over the coming 3 – 4 months.

Of course, all this would depend on the trajectory of economic activity in this period. Certainly, market sentiment has been buoyed by the seeming truce between the US and China on trade. But, recall that during 2019, there was clear evidence that US economic activity was slowing down. Indeed, the reason for the market’s pricing to swing from hikes to cuts was due to concerns that the Fed was slow in cutting the policy rate in response to the economic slowdown occasioned by escalating trade tariffs.

**Figure 3: US Treasury 10-y yields below Fed Funds rate**

Source: Bloomberg

So, the market will need a body of evidence that growth in US economic activity is gathering momentum before unwinding expectations for further rate cuts. As things stand, most economists anticipate a slower pace of growth of the US economy in 2020 than in 2019. Our G10 strategist Steve Barrow expects growth of 1.5% y/y in 2020,

from what he estimates was 2.0% y/y growth in 2019. Evidently, the market believes that such a deceleration would require further stimulus from the Fed.

In line with the market’s view on the Fed Funds rate, the consensus expectation is for US 10-y Treasury yields to be around 1.9% this year, marginally higher than the current levels. Barrow expects the 10-y yield to end the year at 2.0%, rising further to 2.15% by end Q2:21 but only after the rate first dips to 1.5% in Q2:20.

**Figure 4: 10-y generic US Treasury and German bund yields**

Source: Bloomberg

What about Eurozone yields? Steve Barrow expects Eurozone yields to initially fall further, becoming more negative, before reversing course from Q4:20 onwards. He expects the 10-y Bund yield to drop to -0.6% at end Q3:20, before rising to -0.5% by end 202, and rising to -0.3 by end Q2:21. Other developed country central banks are likely to ease monetary policy. The BOE, Bank of Canada, Reserve Bank of Australia, Reserve Bank of New Zealand are the central banks expected to ease monetary policy.

**Figure 5: EM 10-y average bond yields versus US Treasury 10-y yields**

Source: Bloomberg; Standard Bank Research

**Political risks: light electoral calendar in the next 4-m**

None of the countries in our coverage will hold elections over the coming 4-m. But, a handful will hold general elections in H2:20.

The Tanzanian general elections will probably generate a fair amount of noise. In the past, the ruling party tended to win rather comfortably, amid the opposition's allegations of vote-rigging.

It remains to be seen if the ruling party will put forward policy proposals that are a significant departure from current policies. Of course, a number of policy issues could turn out to be pivotal for medium-term economic performance. Perhaps chief among these is the development of the natural gas sector. But the general regulatory backdrop, that has made it difficult for foreign companies to operate in the country, is crucial too.

The Ethiopian elections will also be crucial ones to watch. If anything, they could be a clear sign of whether the Prime Minister's reform agenda has any grassroots support. He has been widely lauded outside the country for the bold reform moves he has made and for advancing peace. With respect to the latter, he went on to win the Nobel Peace Prize.

The reform agenda is probably going to be what matters the most to the electorate. Of course, given the strong federal nature of the government in Ethiopia, the existence of strong regions and tribes, it is hard to say how these elections will play out. But the ruling party probably has the upper hand. Additionally, there would probably be more attention paid to governance issues, and issues of regional representation in government than opposition to the economic reforms per se.

At face value, the Egyptian parliamentary elections are a risk event. But that is a hard characterisation to justify. Sure, the introduction of a Senate will likely complicate things. But in the National Assembly the representation and power of political parties is heavily diluted. Of the 596 deputies in the current parliamentary term, only 120 represent political parties, with 448 being independents and the remainder appointed by the president.

Only Côte d'Ivoire's and Ghana's elections could be regarded as presenting significant uncertainty. An argument can be made that Ghana's elections do not really represent such a huge risk. After all, the electorate has switched between the NPP, currently in power, and the NDC since multi-party democracy was introduced in 1992, giving each party 2 terms in power. So, if the NPP were to be voted out of power, then this would be a significant departure from history.

The key concern for the market is that the NPP will essentially try to buy the elections by boosting government spending, whether it be recurrent or capital expenditure. Yet the government observed the Fiscal Responsibility Act in budgeting for a 4.7% of GDP fiscal deficit this year. Admittedly, the revenue assumptions may have been somewhat optimistic, requiring that the government restrain spending. Therein lies doubts for the market: expenditure restraint, and, in an election year? Regardless, preliminary data shows that there was spending restraint in 2019, with the government achieving the originally budgeted 4.2% of GDP fiscal deficit.

Côte d'Ivoire's elections are highly unpredictable, something that is likely to keep the market apprehensive. As is the norm, coalitions will be formed in the run-up to the elections. Yet, at this stage it is not clear how these will be composed. President Ouattara, who is serving his second term, and should thus be ineligible to be president, has not announced whether he will run or not. He has previously pointed to what he considers to be grounds to allow him to run again due to the new constitution introduced in 2016. Apparently he will announce his intentions in Jul.

Furthermore, Guillaume Soro, the former President of the National Assembly who fell out with President Ouattara and has been positioning himself for a presidential run, faces an arrest warrant. The public prosecutor alleges that he was involved in a coup

plot last year. Recall, it was Soro and his fighters that turned the tide against Laurent Gbagbo during the civil war in 2010, allowing Ouattara to capture the presidency.

Fracture within the ruling SWAPO in Namibia led to the party losing significant support in last year's elections. A SWAPO member decided to run in the elections as an independent, garnering nearly 30% of the vote, an unprecedented feat. SWAPO also lost some 14 seats in parliament. It remains to be seen if these election results will have reverberations for government policy.

### **FX strategy: slim pickings**

Despite some notable depreciations, there are not a lot of carry opportunities. In the past 4-m, the currencies that depreciated the most were the AOA that depreciated by 25%, the ZMW that depreciated by 10.1%, and the ETB that depreciated by 7.9%.

The USD/AOA move is still mostly policy-determined. Even though the directional bias to the pair is still to the upside, policymakers are looking to provide enduring support to the economy. As part of a package of economic reforms, the government will be privatising some state-owned enterprises over the next 5-y. To help that process along, they have relaxed capital account controls, making it easy for foreign capital to take advantage of any opportunities that this privatisation process may present. They have relaxed requirements for foreign investors to seek approval of the central bank to bring in equity capital into a listed entity.

The central bank has not removed licencing requirements for foreign fixed income investors. To buy government debt securities foreigners still need to obtain a licence from the central bank.

Since trading mostly in a 9.50 – 10.30 range between Mar 16 and Sep 18, USD/ZMW has risen in a stepwise fashion. It stuck around 12.00 for about 7-m, before rising to 13.00, after initially touching 14.00. It stuck around 13.00, then resumed the uptrend to a peak near 15.25. After retracing below 14.00 temporarily, it has been in a range of 14.00 – 15.00 since the beginning of the year. All told, the pair has risen at about a 29% annualised pace since Sep 18.

It is still hard to justify making an allocation to ZMW T-bills. In large part such reluctance is provoked by the seeming unwillingness of policymakers to address persistent fiscal and BOP pressures. To be sure, copper prices have recovered somewhat. It seems highly probable that the volume of water flowing down the Zambezi River will recover sufficiently to revive hydro electricity generation over the next 2-y. This revival might be sufficient to bolster copper production as well, in addition to agricultural production, thereby supporting the BOP. Copper export volumes fell by just over 20% y/y in the 11-m to Nov 19, with electricity supply constraints probably a factor behind this decline.

There is no end in sight to the strong demand for FX to fulfil the government's external debt service obligations. The Bank of Zambia made some USD1.17bn in external debt service payments in the first 11-m of 2019. Budgeted external debt service payments are budgeted to be in excess of USD1.5bn in 2020. Data from the BOZ indicates that demand from the public sector is some 3 times the amount demanded by FX bureaus.

On one hand, clearly this demand is unlikely to shrink in coming years. FX demand by the government is inelastic. But on the other hand, given that it is the government, it can exert moral suasion, or let the BOZ do that on its behalf, to keep USD/ZMW from spiralling upwards in a disorderly fashion. So, for now, we prefer opportunistic exposure via the short-dated NDFs, especially after a sharp depreciation of the ZMW.

The ETB is not typically among the currencies that depreciate the most on the continent. But the pace of depreciation has picked up in recent months. Usually, the

central bank devalues the ETB by a large amount once every few years, then keep the pace of depreciation fairly low, about 5% on an annualised basis.

The movement of the exchange rate in recent months seems like quite a departure from this. Perhaps this departure is understandable given the economic reform program of the government. This program is being supported by a 3-y Extended Credit Facility and an Extended Fund Facility from the IMF. Among the aims of the program are exchange rate reforms to address FX shortages and increase FX flexibility.

These exchange rate reforms were always inevitable. Over time it is likely that the private sector will come to dominate in investment spending in the economy. In combination with other reforms, addressing FX shortages and allowing the exchange rate to reflect the supply-demand balance for FX in the economy looked inevitable. Nevertheless, we are not anticipating that there will be any opportunities for fixed income investors in the near term.

The 13.1% depreciation of the GHS in 2019 is the first double-digit pace of depreciation since the 13.9% depreciation in 2015. Of course, 2015 was a pre-election year. The GHS depreciated by 9.2% in 2016. Arguably, the market may have been somewhat mollified by the existence of an IMF-funded program at that time. The government was on a fiscal consolidation path.

Could the upcoming elections in 2020 be a factor pushing USD/GHS materially higher? Certainly, many investors have expressed trepidation at the prospect of an election while the government is without an IMF-funded program. The fear is that there could be fiscal overruns that would keep import demand strong, thus leading to the FX pressures. Of course, such overruns would worsen the debt picture.

We continue to highlight the fact that such trepidation has not translated into a notable reduction in exposure to GHS bonds. The Central Securities Depository indicates that foreigners were holders of GHS29.07bn in GHS bonds in Dec, compared with GHS27.26bn in Nov. Throughout 2019 the average was close to GHS27.5bn. The peak was GHS29.22bn in Apr 18.

Of course, the BOG was steadfast in its determination to intervene to keep USD/GHS from rising in a disorderly fashion. Arguably, the BOP is in a sufficiently strong position that the BOG can provide FX supply to the market, thereby helping to stabilise the exchange rate for an extended period. It has helped that the government has been willing to issue Eurobonds quite early in the year, granting the BOG the ability to boost FX reserves and use those to intervene in the FX market. The government aims to issue Eurobonds early this year, as it did last year. Perhaps this will help to restrain the depreciation pressures in the FX market.

The East African Shillings continue to exhibit broad stability. We see little impetus to change this over the next 4 – 6 months. The KES might enjoy some support in early Q1:20 due to flower export sales. That might reverse somewhat in Q2:20 due to dividend payments.

There will be elections in early 2021 in Uganda. Pre-election noise has typically exerted some pressure on the UGX. But this typically fizzles out closer to elections.

We have maintained exposure to the EGP in our shadow portfolio since May 17 without interruption. We see no reason to relinquish our exposure. But, the EGP has appreciated by about 13.0% over the past 12-m. Strong portfolio inflows have been in evidence, part of the broader improvement in the BOP.

In a low interest rate environment in much of the developed world, it is perhaps not surprising that there has been such strong interest in the EGP market. But we see T-bill

yields falling over the next 4 – 6 months. In part, this will be instigated by the central bank that has every reason to lower policy rates given a favourable inflation outlook. So, as yields decline, so will the attraction of this carry trade.

For now, we have no reason to relinquish our exposure to the NGN either. The desire of policymakers to maintain USD/NGN in a narrow 360 – 365 range is undiminished. With oil prices holding above USD60/bbl, there shouldn't be much trepidation on their part.

That notwithstanding, FX reserves have fallen rather sharply in recent months. The 30-d moving average of gross FX reserves fell to just under USD38.3bn in early Jan from over USD45.0bn in Jul. Import demand has picked up notably, fuelled by capital imports as some capital expenditure projects advance. Of course, the decision by the CBN to prohibit non-bank domestic investors from partaking in the OMO bill market triggered some foreign portfolio outflows.

Still, it seems as if FX reserves are stabilising. Furthermore, with OMO bill yields so much higher than T-bill yields, it seems likely that foreign portfolio interest in that market might be revived. The only hindrance is likely to be lack of issuance to allow investors to re-enter the trade.

**Fixed income strategy: contemplating profit-taking**

Our shadow portfolio is nearly composed of local currency bonds. The performance of the EGP and NGN bonds has been stellar in recent months. It has led us to start contemplating taking profits on our positions.

African local currency bonds slightly underperformed emerging market bonds in 2019 as African bond yields did not decline as much as those of emerging markets (Figure 6).

That is not true of Egyptian and Nigerian bond yields. The combination of incessant buying by foreign portfolio investors, declining inflation and monetary policy easing underpinned the reduction in Egyptian bond yields. Of course, the appreciation of the EGP added further to the outperformance of these bonds.

We have been anticipating that the Egyptian yield curve would dis-invert. But this is yet to materialise. Bond yields are now in the low teens, while T-bill yields are in the mid-teens. There seems to be a stronger bias for T-bills to fall faster than bond yields in the coming 4 – 6 months, something that would lead to that dis-inversion. Given that the bias is to the downside for yields across the curve, we will retain our position.

**Figure 6: EM10 versus AF10 average 10-y bond yield**

Source: Bloomberg; Standard Bank Research

**Figure 7: EM10 versus AF10 average 10-y bond return**

Source: Bloomberg; Standard Bank Research

Given that Nigerian inflation has been elevated, we were doubtful if there would be a trigger for bond yields to fall meaningfully. Well, the surprise decision by the CBN to

prohibit local non-bank investors from participating in the OMO bill market forced those investors into buying government paper. This has pushed bond yields into the low teens, and T-bill yields into low single digits. Additionally, it is not issuing as much OMO bills to mop up excess liquidity in the market.

Inflation is still elevated, something that has led the CBN to refrain from lowering the Monetary Policy Rate. We wouldn't rule out the possibility that the CBN would regularise things by lowering the MPR. After all, it has eased its policy stance by allowing excess liquidity to build up in the money market. However, we remain unconvinced of much room for bond yields to fall further.

The case for Ugandan duration requires re-evaluation. The trade has not worked thus far, with yields backing up somewhat since we put it on. However, the currency remains solid.

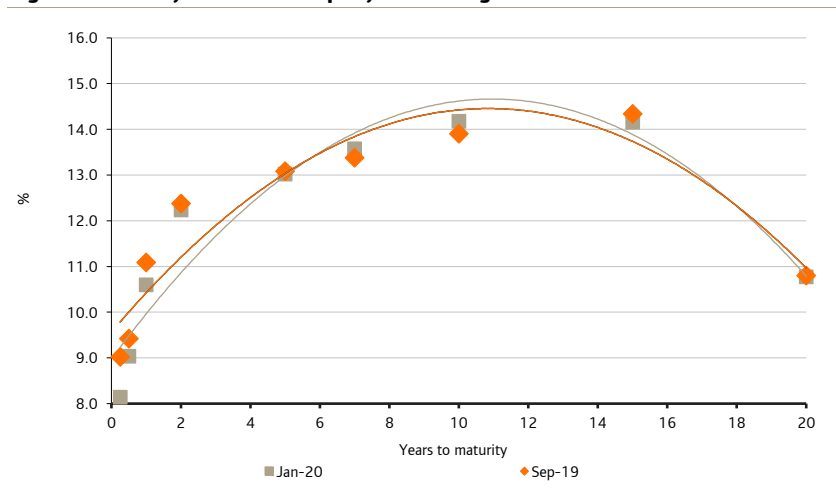

However, there is an election coming up next year. Local investors might start to anticipate that the government will ramp up spending in the lead-up to those elections. Furthermore, the government has been falling behind in its revenue collection targets. All this points to the possibility that yields might remain elevated, if not rise some more.

Truthfully, these dynamics would make the trade even more appealing. In addition to yields potentially rising, there is also a possibility that USD/UGX might also rise somewhat in coming months. Before previous elections we have witnessed plenty of conjecture about a potential boost to import demand that leads to a depreciation of the UGX. But such depreciation tends to peter out, sometimes as much as 6-m before the election. Therein lies our quandary. Do we get out now and re-enter the trade at potentially higher yields and exchange rate in Q3:20, or do we hold on through the possible turbulence in the intervening period?

Our KES duration trade worked out pretty much as we anticipated. The currency appreciated slightly, and yields fell. As Q1:20 progresses, it will be worth considering if this would be the right time to take profit on the trade.

To be clear, the CBK's MPC is more likely to cut than raise interest rates. Inflation is on its way down, and after the repeal of the rate cap, credit growth is continuing to accelerate modestly. Even though the trajectory for USD/KES might reverse in Q2:20, in large part due to a ramp-up in demand from multinational companies for dividend payments, the MPC is unlikely to be unduly concerned by this.

**Figure 8: AF10 yield curve simple yield average**

Source: Bloomberg; Standard Bank Research

Despite irksome fiscal policy management, we have retained our exposure to Zambian duration. Yields are quite elevated, having been in excess of 20% in the primary auction since the end of Dec 18. In fact, BOZ data indicates that the average bond yield rate in the 2-y to Dec 18 was about 19.3%.

Such high bond yields are bound to affect fiscal policy in a fundamental way. There is a strong likelihood that interest expenditure will absorb an ever-rising proportion of revenues, and account for a bigger share of total spending. Barring a fiscal adjustment this scenario could undermine overall macroeconomic stability.

This might be the year that the government finally delivers on the fiscal consolidation to which it has committed itself. We acknowledge, though, that the various shocks to have hit the economy, particularly the drought, could make fiscal consolidation hard to effect.

We have held a GHS bond position since late 2016. At the time, it seemed reasonable to believe that an improving BOP and ongoing disinflation would slow the pace of depreciation of the GHS while also leading to lower government bond yields.

The currency drag on this trade has been far too high. But, interestingly, it has not been consistent. The annual pace of depreciation was 13.1% in 2019, 8.4% and 8.8% in 2018 and 2017 respectively, 9.1% in 2016 and 13.9% in 2015. It still seems reasonable to expect that the GHS will settle into a single-digit pace of depreciation in the medium term. So, perhaps last year's rather fast pace of depreciation, in a pre-election year, is similar to 2015, and will be followed by less depreciation in subsequent years. So, we will keep this position.

### **African Eurobonds: further yield compression, but with volatility**

Since the Sep 19 edition of this report, African Eurobond spreads compressed. The spread over US Treasuries for our SBAFSOZ index – comprising all the USD Eurobonds issued by African governments, except South Africa – dropped to around 500 bps at the time of writing, from about 535 bps at the time of writing the Sep edition.

Even though African Eurobonds outperformed the broader EM in the past 4-m or so, as measured by the EMBI Global Index, EMBI spreads tightened by more. Such tightness of EM spreads, naturally, is a reason for some caution regarding African Eurobonds. EM spreads are lower than they were at the beginning of 2018, before the sell-off that ensued in the early part of that year. But, in the short term, the more subdued risk sentiment is, the more likely it is that the spread compression will continue.

Another reason for caution is impending issuance. Ghana has announced plans to issue up to USD3.0bn in Feb. We wouldn't rule out other issuers over the course of this year. Perhaps Angola, Kenya, Egypt and Nigeria are candidates. Admittedly, the timing for some of these might be in H2:20 rather than H1:20.

We have not changed the composition of our portfolio much since deciding to increase our exposure to long duration bonds some 4-m ago. At that time the spread between longer duration bonds and shorter duration bonds was close to historical highs. For instance, the spread between the Egypt '47s and '23s was nearly 2 standard deviations away from the mean. Similarly, the spread between the Senegal '48s and '21s was nearly 1.9 standard deviations away from the mean. As we anticipated then, the spread is compressing.

Observing that the tensions between the US and China were thawing, we tactically increased our exposure to oil sovereigns, specifically Angola and Nigeria. We are happy to retain this exposure.

# Namibia: an economy in recovery

## GDP growth: close to escaping recession

We see GDP growth at 0.8% y/y in 2020 and 2.0% y/y in 2021, from what we estimate was a 1.7% y/y contraction in 2019 and therefore the likely trough.

The Namibia Statistics Agency has rebased the GDP series, no longer seeing a recession for 2018. The agency now estimates GDP has having grown by 0.3% y/y in that year, and contracting 0.1% y/y and 0.1% y/y in 2017 and 2016 respectively.

The rebased data still indicates depressed domestic demand. Gross domestic expenditure contracted by 2.1% y/y in 2018 after a contraction of 4.5% y/y in 2017 and 0.1% y/y in 2016. Both consumption and fixed investment spending contributed to depressed domestic demand.

However, a recovery is underway. Private consumption spending contracted by 1.3% y/y in 2018, from the 6.3% y/y contraction in 2017. Total employment grew by 7.2% 2016 to 2018 despite the recession in domestic activity between 2016 and 2018. This labour data trend indicates momentum behind the recovery in household consumption spending. Hence, over the next 2-y, we expect private consumption spending to contribute positively to GDP growth.

Similarly, the momentum in investment spending points to the recession in domestic spending ending soon. The pace of contraction in gross fixed capital formation reached 26.8% y/y in 2016. However, this moderated to 9.7% y/y in 2017, and by 2018 GFCF grew by 3.8% y/y.

The pace of contraction in the construction sector has moderated. The sector contracted by 41.1% y/y in 2016, 23.1% y/y in 2017 and 5.4% y/y in 2018; momentum therefore seems sufficient to ensure this sector adding positively to GDP growth.

However, other sectoral data indicates persistent weakness in economic activity. Recession in the construction sector, which has contracted by an average of 23.8% y/y in the last 3-y, contracted by 27.8% y/y in Q1:19.

## Political risks: limited

The 2019 general elections delivered a shock result. Sure, President Geingob was re-elected and SWAPO remains the ruling party, with a healthy majority in parliament. But, President Geingob garnered just 56.3% of the vote, in contrast to his 86.7% in 2014.

An independent candidate, Panduleni Itula, claimed 29.4% of the votes.

Of course, Itula, who defected from SWAPO, received the endorsement of two smaller parties, the Namibian Economic Freedom Fighters (NEFF) and the Republican Party. The NEFF, formed in 2014 by a former SWAPO member, contested the 2014 presidential elections and got less than 0.4% of the votes and no seats in parliament. On the other hand, the Republican Party had 1 seat in parliament after the 2014 elections, and it doubled that this time.

The biggest winner in the National Assembly is the Popular Democratic Movement, formerly known as the Democratic Turnhalle Alliance (DTA). It had its best showing in these elections, gaining 11 seats relative to 2014. SWAPO, meanwhile, lost 14 seats. The newly formed Landless People's Movement, led by former Lands Deputy Minister who was fired in Dec 18, garnered 4 seats.

It is hard to believe that these election results will not prompt some reaction from the ruling party. But it is doubtful if any of it will have much economic policy implications. Itula attacked SWAPO for what he regards as institutionalised corruption. It certainly did not help SWAPO that some corruption scandals broke on the verge of the elections.

## Election results (2019)

Presidential election	Party	% of votes
Hage Geingob	SWAPO	56.3
Panduleni Itula	Independent	29.4
McHenry Venaani	PDM	5.3
Bernadus Swartbooi	LPM	2.7

### Balance of payments: healthy

FX reserves have been fluctuating between USD2.0bn and USD2.6bn since mid-2017. They were at USD2.0bn in Nov 19, covering what we estimate as 4.7-m of imports, having declined from last year's peak of USD2.48bn in Jul. They will likely reverse course, end this year at USD2.4bn, covering 5-m of imports.

Evidently, the BOP is in a healthy position. Indeed, the BNA's MPC has often explicitly conditioned its monetary policy decision on the desire to bolster the BOP position, often stating that its policy decisions were taken to preserve FX reserves.

The C/A deficit will likely increase to 3.2% of GDP this year and 3.7% of GDP in 2021 from what we estimate was 2.5% of GDP in 2019. The C/A deficit has declined consistently in the last 4-y, spurred by the declining trade deficit attributable to restrained goods import demand.

Such contraction was understandable given the weakness in domestic demand. However, as domestic demand picks up, so will goods imports.

A potential upside surprise could emanate from both a rebound in goods exports and stronger current transfer inflows. Goods exports have been strong, with mining production quite robust. This could persist on a multi-year basis. Agricultural output could also rebound, partly reducing import requirements.

SACU receipts peaked at USD1.59bn in 2014, fell to USD1.0bn by 2016. In 2017 and 2018, they amounted to about USD1.37bn and USD1.35bn respectively. We see them falling further in 2020 and 2021. Therein lies a potential upside surprise.

Financial inflows will likely be boosted by government external borrowing to finance the fiscal deficit. We believe that net FDI inflows in the next 2-y will recover from the low levels of 2018.

### FX outlook: volatility in USD/NAD likely transitory

There is no reasonable basis to believe that the 1-to-1 relation between the NAD and ZAR will not be maintained in the next 12 – 24 months. Hence, USD/NAD and USD/ZAR will likely be the same over that period.

Our Head of SA Macro and FIC Research sees USD/ZAR at 14.60 at end-2020 and 14.90 at end-2021, with the ZAR within a range of fair value estimates. There will probably be episodes of elevated volatility, likely triggered by the expected Moody's downgrade to junk. Flux in global sentiment will likely also have an influence, as is typically the case. For example, one can't rule out another twist in US-China trade relations undermining global risk sentiment. But those would likely be transitory influences. After all, the USD seems set to depreciate this year.

### USD/NAD: forwards versus forecasts

Source: Bloomberg; Standard Bank Research

## Monetary policy: easing bias

The bias is for the BON to ease the policy stance this year.

It still seems reasonable that the BON will follow the policy changes made by the SARB. Even though at times the BON diverges from the SARB, such divergence typically does not last very long.

The SARB's MPC has an easing bias. A Moody's downgrade would most likely trigger transitory ZAR weakness but which would not jeopardise South Africa's inflation outlook. Hence, after the expected March downgrade, perhaps in Jul the SARB's MPC is likely to deliver one more rate cut. Such a cut would most likely prompt the BON's MPC to follow suit.

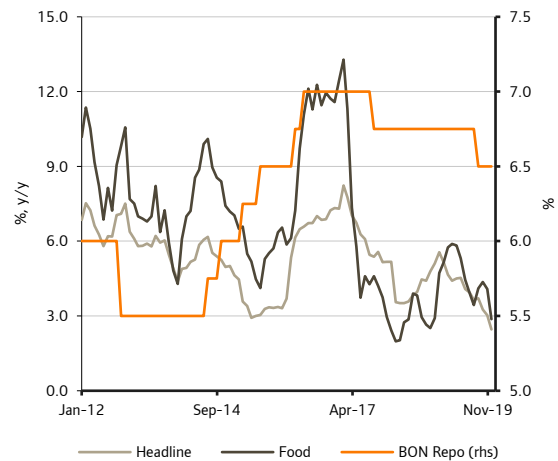

The BON's MPC cut the repo rate following the policy meeting in Aug. Supporting domestic economic activity was a factor that motivated the decision. Continued weakness of the economy probably still tilts the balance towards further easing.

The trajectory of headline inflation is another factor that warrants an easier policy stance. Headline inflation has been mostly below the 4.5% y/y mid-point of the target range since early 2018. It will likely tip over this, ending the year at 4.8% y/y and averaging 4.0% y/y for the year. Then it will likely hold close to 4.5% y/y over the course of 2021.

The upside pressure on food inflation in early 2019 seems to have subsided. Having accelerated to an average of 5.8% y/y in Q1:19, from an average of 3.2% y/y in 2018, food inflation decelerated to an average of 4.6% y/y in Q2:19 and an average of 4.0% y/y in Q3:19. It was 2.9% y/y in Nov.

No other sub-index rose by more than 5.0% y/y in Dec besides the education sub-index which rose over 10% y/y in 2019.

## Yield curve outlook: downside bias

We still anticipate bull-steepening of the yield curve over the coming 6-m, partly driven by the BON's policy stance, with easing likely to be followed by lower T-bill yields. Curiously, T-bill yields initially fell after the BON cut the repo rate in Aug. But these reversed course from about mid-Oct. Since then, the 91-d T-bill yield has increased by some 59 bps, the 182-d yield is up by about 38 bps and the 364-d yield is up about 43 bps. This goes against the prevailing monetary policy trend.

Sure, the government has made it clear that it will look to source some 70% of its financing needs from the domestic market in the medium term. Clearly, this implies considerable issuance in coming years, something that would exert some upward pressure on yields. But we doubt that, with weak growth in economic activity in the near term, dampening underlying inflation pressures in the economy, the government will accept persistently high yields.

## Yield curve changes

### Fiscal policy: sounds conservative, but debt rising

The Finance Minister struck a conservative tone when he presented the 2019 Mid-Year Budget Review in Oct. Even though the government’s forecast is for GDP growth to be 0.8% y/y in 2020 and 1.3% y/y in 2021, from contraction of 1.5% y/y in 2019, it still advised caution with respect to revenue forecasts.

In the first 6-m of the fiscal year, total revenue collection was up 2.4% y/y, while expenditure was down by 6.4% y/y, leading to a somewhat lower fiscal deficit. But the government believes that the execution rate of developmental expenditure will improve over the remainder of the fiscal year, leading to a fiscal deficit in line with the budget.

The government’s medium-term expectation is for revenue growth to average 4.0% y/y, with total revenue collection being in the vicinity of 29% - 30% of GDP. Among the factors likely to undermine revenue collection are potentially sticky wages and lacklustre job growth to would restrain growth in personal income taxes. Additionally, as deposits of diamonds are depleted, the contribution of diamond mining companies to corporate income taxes will likely be restrained.

In the medium term the government is committed to restraining the fiscal deficit, in part to arrest growth in debt levels. From a budgeted 4.1% of GDP in FY2019/20 the government is looking to reduce this to 3.5% of GDP in FY2020/21.

The government used to stress 40% of GDP as a target debt level that it was committed to achieving. Yet its current medium-term projections show total debt climbing over 50% of GDP in FY2020/21 and reaching 53.1% of GDP by FY2022/23.

Evidently, the government will be relying more on domestic rather than external debt to finance its fiscal deficits in the medium term. It projects external debt remaining between 16.0% and 16.5% of GDP over this horizon.

### Central government budget

	FY2017/18	FY2018/19	FY2019/20
<b>% of GDP</b>	<b>Actual</b>	<b>Estimated</b>	<b>Budgeted</b>
<b>Total revenue and grants</b>	31.9	29.3	29.4

### Fiscal deficit

Source: Ministry of Finance

### Eurobond outlook: market weight

We will retain market weight exposure to the Namibian Eurobonds. Yet, we concede that issuance risk is probably minimal. The government seems more intent on ensuring that it manages roll-over risk when the '21s mature. It intends to finance 70% of its borrowing needs from the domestic market and the remainder externally.

With respect to external borrowing, the government prefers concessional loans but admits limited capacity to raise financing from the domestic market. Earlier in 2019 the domestic asset requirement for pension funds was lifted to 45% of total assets from 42.5%. While this created a boost in demand for paper, the government admits that this extra demand has already dried up. The upshot is that even as the government seems unwilling to come back to the Eurobond market, circumstances might eventually force it to do so.

## Glossary

For brevity, we frequently use acronyms that refer to specific institutions or economic concepts. For reference, below we spell out these and provide definitions of some economic concepts that they represent.

<b>14-d</b>	14-day, as in 14-d deposit, which denotes 14 day deposit
<b>10-y</b>	10-year
<b>16 Jan 13</b>	16 January 2013
<b>3-m</b>	3 months
<b>3m</b>	3 million, as in USD3m, which denotes 3 million US dollars
<b>3bn</b>	3 billion, as in UGX3bn, which denotes 3 billion Ugandan shillings
<b>3tr</b>	3 trillion, as in TZS3.0tr, which denotes 3 trillion Tanzanian shillings
<b>AOA</b>	Angola Kwanza
<b>BAM</b>	Bank Al Maghrib
<b>BCC</b>	Banque Central du Congo (Central Bank of Congo)
<b>BCEAO</b>	Banque Central des États de L’Afrique de l’Ouest (Central Bank of West African States)
<b>BCT</b>	Banque Central de Tunisie
<b>BM</b>	Banco de Moçambique
<b>BNA</b>	Banco Nacional de Angola
<b>BOB</b>	Bank of Botswana
<b>BOG</b>	Bank of Ghana
<b>BOM</b>	Bank of Mauritius
<b>BON</b>	Bank of Namibia
<b>BOP</b>	Balance of payments – a summary position of a country’s financial transactions with the rest of the world. It encompasses all international transactions in goods, services, income, transfers, financial claims and liabilities.
<b>BOT</b>	Bank of Tanzania
<b>BOU</b>	Bank of Uganda
<b>BOZ</b>	Bank of Zambia
<b>BR</b>	Bank Rate (Reserve Bank of Malawi)
<b>BRVM</b>	Bourse Régionale des Valeurs Mobilières (Regional Securities Exchange)
<b>BWP</b>	Botswana Pula

<b>C/A</b>	Current account balance. This is the sum of the visible trade balance and the net invisible balance of a country. The latter includes net service, income and transfer payments.
<b>Capital account</b>	Captures the net change in investment and asset ownership for a nation by netting out a country's inflow and outflow of public and private international investment.
<b>CBE</b>	Central Bank of Egypt
<b>CBK</b>	Central Bank of Kenya
<b>CBR</b>	Central Bank Rate
<b>CDF</b>	Congolese Franc
<b>CPI</b>	Consumer Price Index – An index that captures the average price of a basket of goods and services representative of the consumption expenditure of households within an economy.
<b>Discount rate</b>	Policy rate for Bank of Uganda
<b>Disinflation</b>	A decline in the rate of inflation. Here prices are still rising but with a slower momentum.
<b>Disposable income</b>	After tax income
<b>DM</b>	Developed markets
<b>ECB</b>	European Central Bank
<b>EGP</b>	Egyptian pound
<b>EM</b>	Emerging markets
<b>ETB</b>	Ethiopian Birr
<b>Eurobond</b>	A bond denominated in a currency other than the home currency of the issuer.
<b>Exports</b>	The monetary value of all goods and services produced in a country but consumed abroad.
<b>FMDQ</b>	FMDQ OTC Securities Exchange, Nigeria
<b>FX</b>	Foreign Exchange
<b>FY2016/17</b>	2016/17 fiscal year
<b>GCE</b>	Government Consumption Expenditure - Government outlays on goods and services that are used for the direct satisfaction of the needs of individuals or groups within the community. This would normally include all non-capital government spending.
<b>GDE</b>	Gross domestic expenditure, the market value of all goods and services consumed in a country – both private and public – including imports but excluding exports. This is measured over a period of time – usually a quarter/year.
<b>GFCF</b>	Gross Fixed Capital Formation – this is investment spending, the addition to capital stock such as equipment, transportation assets, electricity infrastructure, etc to replace the existing stock of productive capital that is used in the production of goods and services in a given period of time, usually a year/quarter. Normally, the higher the rate of capital, the faster an economy can grow.
<b>GDP</b>	Gross Domestic Product – the monetary value of all finished goods and services produced in a country in a specific period, usually a year/quarter.

<b>GHS</b>	Ghanaian Cedi
<b>H1:16</b>	First half of 2016
<b>Imports</b>	The monetary value of goods and services produced abroad and consumed locally.
<b>Inflation</b>	The rate at which the general level of prices of goods and services are rising. It is usually measured as the percentage change in the consumer price index over a specific period, usually a month/year.
<b>Invisible trade balance</b>	The value of exports of services, income and transfers, less imports of same.
<b>Jan 16</b>	January 2016
<b>KBRR</b>	Kenya Bankers' Reference Rate
<b>KES</b>	Kenya Shilling
<b>KR</b>	Key Rate (Bank Al Maghrib)
<b>KRR</b>	Key Repo Rate
<b>m/m</b>	Month on month, in reference to a rate of change
<b>MAD</b>	Moroccan Dirham
<b>MLF</b>	Marginal Lending Facility
<b>MOF</b>	Ministry of Finance
<b>MPC</b>	Monetary Policy Committee, the committee that makes the decision on policy rates
<b>MPR</b>	Monetary Policy Rate
<b>MUR</b>	Mauritian Rupee
<b>MWK</b>	Malawian Kwacha
<b>MZN</b>	Mozambican Metical
<b>NAD</b>	Namibian Dollar
<b>NBE</b>	National Bank of Ethiopia
<b>NBR</b>	National Bank of Rwanda
<b>NEER</b>	Nominal Effective Exchange Rate. This is the weighted average rate at which a country's currency exchanges for a basket of currencies, usually trading partner currencies. It is measured in index format.
<b>NGN</b>	Nigerian Naira
<b>Nominal GDP</b>	The monetary value of all finished goods and services produced in a country in a specific period, usually a year/quarter, measured in current prices.
<b>NPL</b>	Non-Performing Loans

<b>Parity</b>	Refers to the par or nominal value of a debt instrument. This is usually the price at which the said instrument is redeemed on maturity.
<b>PCE or HCE</b>	Personal or Household Consumption Expenditure: The monetary value of household purchases of durable goods, non-durable goods, semi durables and services within a given period of time, usually a year/quarter.
<b>PR</b>	Policy Rate
<b>Prime rate</b>	key lending rate
<b>q/q</b>	quarter on quarter, in reference to a rate of change
<b>Q1:16</b>	First quarter of 2016
<b>RBM</b>	Reserve Bank of Malawi
<b>Real GDP</b>	The monetary value of all finished goods and services produced in a country in a specific period, usually a year/quarter, measured in constant prices.
<b>REER</b>	Real Effective Exchange Rate. This is the weighted average rate at which a country's currency exchanges for a basket of currencies - usually trading partner currencies - while taking into account any changes in relative prices between the host country and its trading partners. It is often measured in index format.
<b>RWF</b>	Rwandan Frank
<b>SARB</b>	South African Reserve Bank
<b>SDF</b>	Standing Deposit Facility (Mozambique)
<b>SLF</b>	Standing Lending Facility (Mozambique)
<b>T-bill</b>	Treasury bill – A short-dated, government backed security that yields no interest but is issued at a discount over a period of less than one year.
<b>TND</b>	Tunisian Dinar
<b>Treasury bond</b>	A marketable government debt security with a maturity of a year or longer
<b>TZS</b>	Tanzanian Shilling
<b>UGX</b>	Uganda Shilling
<b>USD</b>	US Dollar
<b>VAT</b>	Value Added Tax
<b>Visible trade balance</b>	The value of exports of visible goods less imports.
<b>WAEMU</b>	West African Economic and Monetary Union, also known as Union Economique et Monetaire Ouest Africaine (UEMOA)
<b>XAF</b>	Central African Franc
<b>XOF</b>	West African Franc
<b>y/y</b>	Year on year, in reference to a rate of change

<b>Yield</b>	The return on an investment, usually expressed as a percentage over a period of time, usually a year.
<b>YTD</b>	Year to date
<b>ZAR</b>	South African Rand
<b>ZMW</b>	Zambian Kwacha

## Protection of Personal Information Consent

Standard Bank Group, its subsidiaries and associate business units (including Standard Bank Research) have committed to treat the personal information that it collects as private and confidential and has published a comprehensive privacy statement accessible on this [link](#). Should you wish to withdraw your consent to the processing of your personal information kindly email [ResearchCompliance@standardbank.co.za](mailto:ResearchCompliance@standardbank.co.za)

<b>Client:</b>	means, for the purpose of this section, any natural or juristic person acting through their duly authorised representative(s), who has subscribed to or consented to being subscribed to receiving research Services
<b>Personal Information:</b>	means information relating to an identifiable, natural or juristic person, including information relating to race, gender, sex, marital status, nationality, ethnic or social origin, colour, sexual orientation, age, physical or mental health, religion, belief, disability, language, birth, education, identity number, telephone number, email, postal or street address, biometric information and financial, criminal or employment history as well as correspondence sent by the person that is implicitly or explicitly of a private or confidential nature or further correspondence that would reveal the contents of the original correspondence.
<b>Process:</b>	means any operation or activity, whether automated or not, concerning Personal Information, including collection, receipt, recording, organisation, collation, storage, updating, modification, retrieval, alteration, consultation, use, dissemination (whether by means of transmission, distribution or making available in any form), merging, linking, blocking, degradation, erasure or destruction
<b>Research Reports:</b>	means investment research reports, in relation to the Services, prepared by an independent research analyst, non-independent research analyst or strategist who is part of an investment research team in a stock brokerage, global markets desk or corporate and investment bank environment.
<b>Services:</b>	means, <i>inter alia</i> , the provision of the Research Reports and other communications and events with respect to equities, market strategy, companies, industries, commodities and countries and associated sales and trading commentary by Standard Bank Research ("SBR")

### CONSENT FOR PROCESSING PERSONAL INFORMATION

#### 1.1 The Client acknowledges that:

- 1.1.1 Applicable laws may at times require SBR to collect the Client's Personal Information;
- 1.1.2 Personal Information may be collected from public sources;
- 1.1.3 SBR may be unable to fulfil its regulatory obligations and provide Services to the Client without Processing the Client's Personal Information;
- 1.1.4 All Personal Information which the Client provides to SBR is voluntarily provided;
- 1.1.5 SBR shall determine the Services and means of Processing any Personal Information that is provided by the Client;
- 1.1.6 Personal Information may be processed by SBR and/ or, The Standard Bank of South Africa Limited and/or its associated entities or duly authorised third party service providers.
- 1.1.7 The Client consents to SBR processing its Personal Information in order to:
  - 1.1.7.1 create and administer the Client's profile as contemplated by regulation;
  - 1.1.7.2 carry out statistical and other analysis to identify potential markets and trends;
  - 1.1.7.3 develop new products and services; and/or
  - 1.1.7.4 any other purpose SBR reasonably believe is required to fulfil its obligations in accordance with regulation or this agreement.
- 1.1.8 The Client has consented to the Processing of its Personal Information for the purpose of clause 1. 7 above.
- 1.1.9 The Client hereby expressly consents that SBR may disclose to or share its Personal Information with duly authorised third parties, which may be located in the Republic of South Africa or other jurisdictions, where it is necessary in order for SBR to fulfil its obligations in accordance with the regulation and/or this agreement.
- 1.1.10 SBR will require any third-party service providers to whom the Client's Personal Information is provided to agree to SBR's data privacy principles policy and practices in accordance with the prevailing regulations including data privacy laws.

SBG believes the information and opinions in the Disclosure Appendix of this report are accurate and complete. Information and opinions presented in the other sections of this communication were obtained or derived from sources SBG believes are reliable, but SBG makes no representations as to their accuracy or completeness. Additional information is available upon request. SBG accepts no liability for loss arising from the use of the material presented in this report, except that this exclusion of liability does not apply to the extent that liability arises under specific statutes or regulations applicable to SBG.

The services, securities and investments discussed in this material may not be available to nor suitable for all investors. Investors should make their own investment decisions based upon their own financial objectives and financial resources and it should be noted that investment involves risk, including the risk of capital loss. Past performance is no guide to future performance. In relation to securities denominated in foreign currency, movements in exchange rates will have an effect on the value, either favourable or unfavourable. Some investments discussed in this marketing communication have a high level of volatility. High volatility investments may experience sudden and large falls in their value causing losses when that investment is realised. Those losses may equal your original investment. Indeed, in the case of some investments the potential losses may exceed the amount of initial investment, in such circumstances you may be required to pay more money to support those losses. Income yields from investments may fluctuate and, in consequence, initial capital paid to make them investment may be used as part of that income yield. Some investments may not be readily realisable and it may be difficult to sell or realize those investments, similarly it may prove difficult for you to obtain reliable information about the value, or risks, to which such an investment is exposed.
