Tailwinds coming up

- Over the past 12-15 months, the global backdrop increasingly posed a headwind to the economic growth outlook for Africa. Uncertainty triggered by the US-China trade war, the removal of monetary policy support in some developed countries, together with outright tightening of monetary policy in others, prompted downward revisions to consensus forecasts for global growth in 2020 and 2021. However, we believe that global growth forecasts for 2020 and perhaps 2021, which already indicate acceleration from 2019, will be revised upwards. We expect elevated global financial markets and growth in developed economies to boost economic growth in Africa.
- There has been much hype about the proposed changes to the XOF. We now propose some questions and answers: Is the chance of devaluation for the reformed XOF greater or less than the previous arrangement? Greater. Are there hedging instruments that one could use to manage this risk? Yes. How can one know if there is anything that will change operationally for businesses operating in the region because of the reform? From regulatory pronouncements made by the Banque Centrale des Etats de l'Afrique de l'Ouest (BCEAO).
- In formulating views about the evolution of the commodity producing economies in our coverage, it seems reasonable to assume that oil prices will range mostly around USD60/bbl USD65/bbl in 2020. For copper prices, a range of USD6,200/MT USD6,500/MT seems reasonable. Sure, over the course of the year there might be a fair bit of volatility, perhaps occasioned by trade anxiety or a flare-up of geopolitical noise. But it seems unlikely that prices will deviate much from their recent ranges.
- Risk assets have rallied tremendously since 2009, with some commentators now
 observing market frothiness. Yet others suggest that the US equity market rally
 specifically is the 'most unloved' in history. Evidently, the rally has benefited only a
 small section of the investing public, with large amounts of cash sitting on the sidelines. While a correction might be underway, with the scare due to the coronavirus
 outbreak weighing on market sentiment, it is hard to say that the rally is ending.
- We still see the Eurobond market continuing to rally in the next 2 3 months. We like Egypt and Senegal and we retain our tactical overweight exposure to Angola and Nigeria.
- In local rates markets, the Ugandan duration trade probably needs re-evaluation. We still like the trade but expect some transitory pressure against the trade between Q2:20 and Q3:20. Given how much the other positions in our shadow portfolio have rallied, such as the KES, NGN and EGP, we are more inclined to take profits in coming months. Implied NDF yields are too low across the board, except on the USD/ZMW, but the pressure on the ZMW seems set to persist.

Global growth – turning into a tailwind for Africa

Developed countries' GDP growth is widely expected to slow in 2020. But, that has been the case for at least a year already. Moreover, forecast revisions have tended to the downside.

The slowdown among developed countries was not the only reason economic growth in Africa failed to meet our expectations but it admittedly was a significant factor. There was drought that affected agricultural production in some countries in Southern Africa. In Zambia and Zimbabwe, the severity of the drought also constrained hydro-electricity generation.

Clearly, the US-China trade war had an impact on the trajectory of copper prices, thereby affecting Zambian economic activity. Now that there is a US/China truce of sorts, an uptick in commodity prices that might turn out positively for copper production seems possible.

Significant policy missteps in some countries may explain their persistent economic underperformance. Policymakers in these countries probably need to redouble their efforts to boost investment spending and address infrastructural bottlenecks. To attract capital for such investment spending, these governments would find the going easier if global financial market sentiment remained elevated.

Even though most forecasters have been downwardly revising their forecasts for global GDP growth in both 2019 and 2020, these forecasts still point to acceleration in both years. Moreover, we are now probably close to the bottom of these revisions. From now on, we'd foresee 2020 revisions as upwards. This is true of both African economies and developed market economies. Ebullient global financial markets and faster growth in developed economies should therefore support economic growth in Africa.

African currency unions – much hype, little impact

It would seem every time that some regional trading block on the continent makes a pronouncement about possibly adopting a common currency, new fresh insights on the topic of regional currencies arise.

It is worth pointing out that the East African Community (EAC), the Southern African Development Community (SADC) and the Economic Community of West African States (ECOWAS) have all, at some point or other, made a commitment to adopting a single currency by some stipulated deadline. Since 2000, all these trading blocks have made such commitments, then changed them, and recommitted to new dates.

Besides these postponements is the flurry of speculation and conjecture that such pronouncements provoke each time. But, when nothing changes, ordinary lives resume, only for the flurry of speculation to be revived when another block makes a pronouncement.

This is not to say that these regional trading blocks won't ever promulgate common currencies. But one should separate regulatory pronouncements from political bluster. If a common currency is to be adopted in a region, then the central banks in that region would develop regulations and guidelines to effect the creation of such a common currency. Similarly, regulators for other business sectors, like pension funds, would also issue regulations affecting those industries. Once those have been communicated, compliance with them would be mandatory for all citizens of the countries in that trading block. Everything else would amount to speculation based on what may turn out mere political bluster.

So, for citizens in a trading block that is purportedly going to introduce a common currency, it is far more instructive to keep track and comply with the applicable regulations in that trading block.

One doesn't need to know the date that the SADC or the EAC has committed to adopting a common currency. When that date approaches, there will be increased hype about it. But, considering that various pronouncements have been made over the last 20-y, is there any reasonable basis for one to determine if the current currency arrangements will be any different in another 5-y? Probably not. But it is perhaps a reasonable starting point to say that the probability of the status quo being maintained is closer to 100% than to 0%. Is there a way of telling if such a change, were it to happen, would be deleterious, and if so, an acceptable way of mitigating the risks now? Also probably not.

It is always worth keeping in mind that the establishment of a common currency would be the result of a political process, a potentially long and tortuous process.

Specifically, for investors in the XOF region, the question boils down to whether a new regime there would imply a greater chance of depreciation than has transpired since

1994 when the CFA franc was last devalued. If one follows our logic from above, then the probability that the GHS and NGN will still be around in 5-y is close to 100%.

But members of the Union Economique et Monétaire Ouest-Africaine (UEMOA) that use the XOF have taken decisions that will reform that arrangement. There will no longer be French representatives in the governance structures for the XOF. The region's FX reserves will be managed by the Banque Centrale des Etats de l'Afrique de l'Ouest (BCEAO) rather than having half of them pledged to the French Treasury. However, the latter would still guarantee convertibility of the XOF.

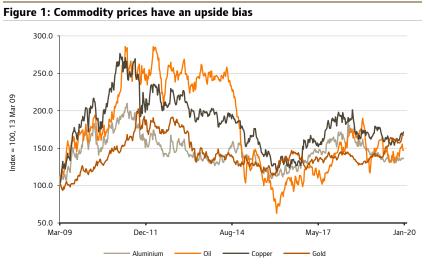

Notably, these changes are meant as preparation for the adoption of the ECO as a single currency for ECOWAS, which is made up of UEMOA and the West African Monetary Zone (WAMZ). Crucially, members of the WAMZ have their own currencies. Nigeria has a GDP that is about 40% of ECOWAS. Presumably, adoption of a single currency would not be a replication of the XOF mechanism for the entire ECOWAS.

After all, it is worth pointing out that the CFA franc mechanism is a combination of a monetary union and a currency peg. This removes policy flexibility for individual members in a monetary union. For example, they lose the ability to manage monetary policy, as such authority would be housed in a regional central bank, as is the case for UEMOA. There would be restrictions on fiscal policy conduct. Lastly, policymakers must commit to entrenching a policy framework that relies on gaining external competitiveness via productivity improvements rather than currency devaluation.

There is a lot that is uncertain at present, not least of which is for which currency regime ECOWAS will ultimately settle. Is the ECO going to be pegged, a managed float, or free-floating? Perhaps members of the WAMZ value policy flexibility more than those in UEMOA. In that case, the ECO arrangement would be less restrictive than the XOF arrangement.

It seems reasonable to believe that if ECOWAS will ultimately adopt the ECO as a common currency, it would have a greater chance of depreciating than the XOF. But, right now, there is probably nothing worth doing to prepare for such a change. Of course, there is no way of knowing when the ECO will start being used in actual transactions. The bottom line is that despite all the hype about the ECO in West Africa, as a practical matter, there is probably no cost to operating as if the status quo will prevail for the next 5-y.

Commodity prices: inching higher

Source: Bloomberg

It seems likely that commodity prices will rise in the next 4-m. For much of H2:19, commodity prices were bottoming out, especially base metals prices. Copper prices hovered around the USD6,000/MT level in late-2018. The recovery in early 2019 was cut short once prices got around USD6,500/MT in early 2019, and reverted to just below USD6,000/MT for much of H2:19.

Such downward pressure was understandable given the mounting anxiety about the global growth outlook precipitated by the US-China trade conflict. Consensus forecasts for copper prices were consistently revised lower in 2019. Yet, these have been revised higher since Dec, with consensus forecasts putting copper prices at USD6,200/MT at the end of this year, up USD450/MT from the forecast at the end of Dec.

We wouldn't be surprised to see these forecasts nudged higher this year. The theme of supply constraints keeps coming up among copper analysts. There has been occasional, isolated speculation that copper prices could rise above USD7,000/MT, although, clearly, that is not the consensus view. Be that as it may, it seems as if the risks are biased to the upside despite any volatility occasioned by geopolitical or trade shocks.

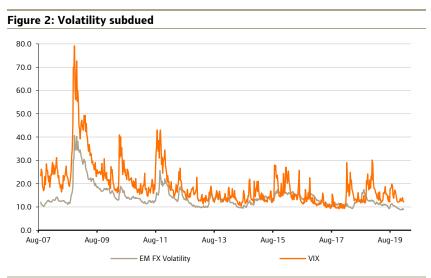

This was not limited to copper prices. The London Metals Exchange's LMEX index bobbled around the 2,800 level for much of H2:19, with the upside capped at about 2,860. It has been nudging this level since end 2019.

There is still plenty to suggest that oil prices will remain mostly above USD60.0/bbl over the next 4-6 months. Geopolitical strains, especially surrounding Iran, could keep prices elevated. Additionally, OPEC seems prepared to stick with production quotas to keep prices elevated.

Consensus forecasts for oil prices drifted marginally lower in Q4:19, with forecasts for the Brent crude oil price at the end of 2020 approaching USD60/bbl. But these are inching higher. For our macroeconomic forecasting purposes, we have assumed prices will be around USD60/bbl – USD65/bbl this year.

Global risk appetite: further rally in risk assets still likely

Since publication of the Sep edition of this report, the S&P 500 Volatility index has been mostly below 15, falling closer to the 12 level at the time of writing. It jumped to just over 20 temporarily in early Oct, but the trend has been to the downside.

Source: Bloomberg; Standard Bank Research

Perhaps this is to be expected given that the US equity markets have been consistently rallying, making record highs over the past 3-m.

By some accounts, the performance of the US equity markets seems the embodiment of market frothiness inspired by loose monetary policy. This characterisation could apply to all risk assets, since most returned around 20% in 2019, as the table on page 2 shows. Indeed, the strong US equity market performance was replicated by other developed market equities, romping ahead of their emerging market counterparts.

Yet other accounts characterise this rally as being the most unloved, with considerable amounts of cash sitting on the side-lines as some investors fret over risks that might derail this rally that has now broken all kinds of records. There are other indicators that point to plenty of anxiety in the market despite the low levels of the VIX index. Lately, the outbreak of the coronavirus is causing jitters in the markets. Bellicose trade rhetoric from the US administration may agitate markets over the next 4-6 months. However, electoral aspirations may influence the US president's approach to trade. Arguably, there is little to be gained by the US president in starting another skirmish that might undermine sentiment and slow the real economy. With the re-negotiated NAFTA and the phase 1 of the China trade pact under his belt, he has plenty to bask in.

Global rates: sustained monetary stimulus

Even though the US Federal Reserve's Federal Open Market Committee has been hinting at keeping the Fed Funds rate steady for a prolonged period, the market is still expecting another rate cut. Still, these expectations are for H2:20 rather than H1:20. Consensus forecasts for the Fed Funds rate at the end of Q4:20 have now drifted marginally higher in the past 2-3 weeks. Even market pricing for the Fed Funds rate suggests that conviction in the rate cut view has been waning. Perhaps if economic data keeps up a strong showing, the consensus forecasts will gravitate towards a no rate cut view over the coming 3-4 months.

Of course, all this would depend on the trajectory of economic activity in this period. Certainly, market sentiment has been buoyed by the seeming truce between the US and China on trade. But, recall that during 2019, there was clear evidence that US economic activity was slowing down. Indeed, the reason for the market's pricing to swing from hikes to cuts was due to concerns that the Fed was slow in cutting the policy rate in response to the economic slowdown occasioned by escalating trade tariffs.

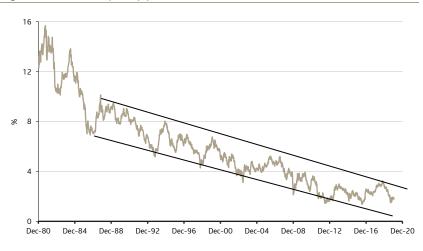

Figure 3: US Treasury 10-y yields below Fed Funds rate

Source: Bloomberg

So, the market will need a body of evidence that growth in US economic activity is gathering momentum before unwinding expectations for further rate cuts. As things stand, most economists anticipate a slower pace of growth of the US economy in 2020 than in 2019. Our G10 strategist Steve Barrow expects growth of 1.5% y/y in 2020,

from what he estimates was 2.0% y/y growth in 2019. Evidently, the market believes that such a deceleration would require further stimulus from the Fed.

In line with the market's view on the Fed Funds rate, the consensus expectation is for US 10-y Treasury yields to be around 1.9% this year, marginally higher than the current levels. Barrow expects the 10-y yield to end the year at 2.0%, rising further to 2.15% by end Q2:21 but only after the rate first dips to 1.5% in Q2:20.

Figure 4: 10-y generic US Treasury and German bund yields

Source: Bloomberg

What about Eurozone yields? Steve Barrow expects Eurozone yields to initially fall further, becoming more negative, before reversing course from Q4:20 onwards. He expects the 10-y Bund yield to drop to -0.6% at end Q3:20, before rising to -0.5% by end 202, and rising to -0.3 by end Q2:21. Other developed country central banks are likely to ease monetary policy. The BOE, Bank of Canada, Reserve Bank of Australia, Reserve Bank of New Zealand are the central banks expected to ease monetary policy.

Political risks: light electoral calendar in the next 4-m

None of the countries in our coverage will hold elections over the coming 4-m. But, a handful will hold general elections in H2:20.

January 2020

The Tanzanian general elections will probably generate a fair amount of noise. In the past, the ruling party tended to win rather comfortably, amid the opposition's allegations of vote-rigging.

It remains to be seen if the ruling party will put forward policy proposals that are a significant departure from current policies. Of course, a number of policy issues could turn out to be pivotal for medium-term economic performance. Perhaps chief among these is the development of the natural gas sector. But the general regulatory backdrop, that has made it difficult for foreign companies to operate in the country, is crucial too.

The Ethiopian elections will also be crucial ones to watch. If anything, they could be a clear sign of whether the Prime Minister's reform agenda has any grassroots support. He has been widely lauded outside the country for the bold reform moves he has made and for advancing peace. With respect to the latter, he went on to win the Nobel Peace Prize.

The reform agenda is probably going to be what matters the most to the electorate. Of course, given the strong federal nature of the government in Ethiopia, the existence of strong regions and tribes, it is hard to say how these elections will play out. But the ruling party probably has the upper hand. Additionally, there would probably be more attention paid to governance issues, and issues of regional representation in government than opposition to the economic reforms per se.

At face value, the Egyptian parliamentary elections are a risk event. But that is a hard characterisation to justify. Sure, the introduction of a Senate will likely complicate things. But in the National Assembly the representation and power of political parties is heavily diluted. Of the 596 deputies in the current parliamentary term, only 120 represent political parties, with 448 being independents and the remainder appointed by the president.

Only Côte d'Ivoire's and Ghana's elections could be regarded as presenting significant uncertainty. An argument can be made that Ghana's elections do not really represent such a huge risk. After all, the electorate has switched between the NPP, currently in power, and the NDC since multi-party democracy was introduced in 1992, giving each party 2 terms in power. So, if the NPP were to be voted out of power, then this would be a significant departure from history.

The key concern for the market is that the NPP will essentially try to buy the elections by boosting government spending, whether it be recurrent or capital expenditure. Yet the government observed the Fiscal Responsibility Act in budgeting for a 4.7% of GDP fiscal deficit this year. Admittedly, the revenue assumptions may have been somewhat optimistic, requiring that the government restrain spending. Therein lies doubts for the market: expenditure restraint, and, in an election year? Regardless, preliminary data shows that there was spending restraint in 2019, with the government achieving the originally budgeted 4.2% of GDP fiscal deficit.

Côte d'Ivoire's elections are highly unpredictable, something that is likely to keep the market apprehensive. As is the norm, coalitions will be formed in the run-up to the elections. Yet, at this stage it is not clear how these will be composed. President Ouattara, who is serving his second term, and should thus be ineligible to be president, has not announced whether he will run or not. He has previously pointed to what he considers to be grounds to allow him to run again due to the new constitution introduced in 2016. Apparently he will announce his intentions in Jul.

Furthermore, Guillaume Soro, the former President of the National Assembly who fell out with President Ouattarra and has been positioning himself for a presidential run, faces an arrest warrant. The public prosecutor alleges that he was involved in a coup

January 2020

plot last year. Recall, it was Soro and his fighters that turned the tide against Laurent Gbagbo during the civil war in 2010, allowing Ouattara to capture the presidency.

Fracture within the ruling SWAPO in Namibia led to the party losing significant support in last year's elections. A SWAPO member decided to run in the elections as an independent, garnering nearly 30% of the vote, an unprecedented feat. SWAPO also lost some 14 seats in parliament. It remains to be seen if these election results will have reverberations for government policy.

FX strategy: slim pickings

Despite some notable depreciations, there are not a lot of carry opportunities. In the past 4-m, the currencies that depreciated the most were the AOA that depreciated by 25%, the ZMW that depreciated by 10.1%, and the ETB that depreciated by 7.9%.

The USD/AOA move is still mostly policy-determined. Even though the directional bias to the pair is still to the upside, policymakers are looking to provide enduring support to the economy. As part of a package of economic reforms, the government will be privatising some state-owned enterprises over the next 5-y. To help that process along, they have relaxed capital account controls, making it easy for foreign capital to take advantage of any opportunities that this privatisation process may present. They have relaxed requirements for foreign investors to seek approval of the central bank to bring in equity capital into a listed entity.

The central bank has not removed licencing requirements for foreign fixed income investors. To buy government debt securities foreigners still need to obtain a licence from the central bank.

Since trading mostly in a 9.50-10.30 range between Mar 16 and Sep 18, USD/ZMW has risen in a stepwise fashion. It stuck around 12.00 for about 7-m, before rising to 13.00, after initially touching 14.00. It stuck around 13.00, then resumed the uptrend to a peak near 15.25. After retracing below 14.00 temporarily, it has been in a range of 14.00-15.00 since the beginning of the year. All told, the pair has risen at about a 29% annualised pace since Sep 18.

It is still hard to justify making an allocation to ZMW T-bills. In large part such reluctance is provoked by the seeming unwillingness of policymakers to address persistent fiscal and BOP pressures. To be sure, copper prices have recovered somewhat. It seems highly probable that the volume of water flowing down the Zambezi River will recover sufficiently to revive hydro electricity generation over the next 2-y. This revival might be sufficient to bolster copper production as well, in addition to agricultural production, thereby supporting the BOP. Copper export volumes fell by just over 20% y/y in the 11-m to Nov 19, with electricity supply constraints probably a factor behind this decline.

There is no end in sight to the strong demand for FX to fulfil the government's external debt service obligations. The Bank of Zambia made some USD1.17bn in external debt service payments in the first 11-m of 2019. Budgeted external debt service payments are budgeted to be in excess of USD1.5bn in 2020. Data from the BOZ indicates that demand from the public sector is some 3 times the amount demanded by FX bureaus.

On one hand, clearly this demand is unlikely to shrink in coming years. FX demand by the government is inelastic. But on the other hand, given that it is the government, it can exert moral suasion, or let the BOZ do that on its behalf, to keep USD/ZMW from spiralling upwards in a disorderly fashion. So, for now, we prefer opportunistic exposure via the short-dated NDFs, especially after a sharp depreciation of the ZMW.

The ETB is not typically among the currencies that depreciate the most on the continent. But the pace of depreciation has picked up in recent months. Usually, the

January 2020

central bank devalues the ETB by a large amount once every few years, then keep the pace of depreciation fairly low, about 5% on an annualised basis.

The movement of the exchange rate in recent months seems like quite a departure from this. Perhaps this departure is understandable given the economic reform program of the government. This program is being supported by a 3-y Extended Credit Facility and an Extended Fund Facility from the IMF. Among the aims of the program are exchange rate reforms to address FX shortages and increase FX flexibility.

These exchange rate reforms were always inevitable. Over time it is likely that the private sector will come to dominate in investment spending in the economy. In combination with other reforms, addressing FX shortages and allowing the exchange rate to reflect the supply-demand balance for FX in the economy looked inevitable. Nevertheless, we are not anticipating that there will be any opportunities for fixed income investors in the near term.

The 13.1% depreciation of the GHS in 2019 is the first double-digit pace of depreciation since the 13.9% depreciation in 2015. Of course, 2015 was a pre-election year. The GHS depreciated by 9.2% in 2016. Arguably, the market may have been somewhat mollified by the existence of an IMF-funded program at that time. The government was on a fiscal consolidation path.

Could the upcoming elections in 2020 be a factor pushing USD/GHS materially higher? Certainly, many investors have expressed trepidation at the prospect of an election while the government is without an IMF-funded program. The fear is that there could be fiscal overruns that would keep import demand strong, thus leading to the FX pressures. Of course, such overruns would worsen the debt picture.

We continue to highlight the fact that such trepidation has not translated into a notable reduction in exposure to GHS bonds. The Central Securities Depository indicates that foreigners were holders of GHS29.07bn in GHS bonds in Dec, compared with GHS27.26bn in Nov. Throughout 2019 the average was close to GHS27.5bn. The peak was GHS29.22bn in Apr 18.

Of course, the BOG was steadfast in its determination to intervene to keep USD/GHS from rising in a disorderly fashion. Arguably, the BOP is in a sufficiently strong position that the BOG can provide FX supply to the market, thereby helping to stabilise the exchange rate for an extended period. It has helped that the government has been willing to issue Eurobonds quite early in the year, granting the BOG the ability to boost FX reserves and use those to intervene in the FX market. The government aims to issue Eurobonds early this year, as it did last year. Perhaps this will help to restrain the depreciation pressures in the FX market.

The East African Shillings continue to exhibit broad stability. We see little impetus to change this over the next 4-6 months. The KES might enjoy some support in early Q1:20 due to flower export sales. That might reverse somewhat in Q2:20 due to dividend payments.

There will be elections in early 2021 in Uganda. Pre-election noise has typically exerted some pressure on the UGX. But this typically fizzles out closer to elections.

We have maintained exposure to the EGP in our shadow portfolio since May 17 without interruption. We see no reason to relinquish our exposure. But, the EGP has appreciated by about 13.0% over the past 12-m. Strong portfolio inflows have been in evidence, part of the broader improvement in the BOP.

In a low interest rate environment in much of the developed world, it is perhaps not surprising that there has been such strong interest in the EGP market. But we see T-bill

yields falling over the next 4-6 months. In part, this will be instigated by the central bank that has every reason to lower policy rates given a favourable inflation outlook. So, as yields decline, so will the attraction of this carry trade.

For now, we have no reason to relinquish our exposure to the NGN either. The desire of policymakers to maintain USD/NGN in a narrow 360 – 365 range is undiminished. With oil prices holding above USD60/bbl, there shouldn't be much trepidation on their part.

That notwithstanding, FX reserves have fallen rather sharply in recent months. The 30-d moving average of gross FX reserves fell to just under USD38.3bn in early Jan from over USD45.0bn in Jul. Import demand has picked up notably, fuelled by capital imports as some capital expenditure projects advance. Of course, the decision by the CBN to prohibit non-bank domestic investors from partaking in the OMO bill market triggered some foreign portfolio outflows.

Still, it seems as if FX reserves are stabilising. Furthermore, with OMO bill yields so much higher than T-bill yields, it seems likely that foreign portfolio interest in that market might be revived. The only hindrance is likely to be lack of issuance to allow investors to re-enter the trade.

Fixed income strategy: contemplating profit-taking

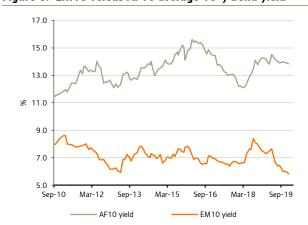

Our shadow portfolio is nearly composed of local currency bonds. The performance of the EGP and NGN bonds has been stellar in recent months. It has led us to start contemplating taking profits on our positions.

African local currency bonds slightly underperformed emerging market bonds in 2019 as African bond yields did not decline as much as those of emerging markets (Figure 6).

That is not true of Egyptian and Nigerian bond yields. The combination of incessant buying by foreign portfolio investors, declining inflation and monetary policy easing underpinned the reduction in Egyptian bond yields. Of course, the appreciation of the EGP added further to the outperformance of these bonds.

We have been anticipating that the Egyptian yield curve would dis-invert. But this is yet to materialise. Bond yields are now in the low teens, while T-bill yields are in the midteens. There seems to be a stronger bias for T-bills to fall faster than bond yields in the coming 4-6 months, something that would lead to that dis-inversion. Given that the bias if to the downside for yields across the curve, we will retain our position.

Figure 6: EM10 versus AF10 average 10-y bond yield

Source: Bloomberg; Standard Bank Research

Figure 7: EM10 versus AF10 average 10-y bond return

Source: Bloomberg; Standard Bank Research

Given that Nigerian inflation has been elevated, we were doubtful if there would be a trigger for bond yields to fall meaningfully. Well, the surprise decision by the CBN to

January 2020

prohibit local non-bank investors from participating in the OMO bill market forced those investors into buying government paper. This has pushed bond yields into the low teens, and T-bill yields into low single digits. Additionally, it is not issuing as much OMO bills to mop up excess liquidity in the market.

Inflation is still elevated, something that has led the CBN to refrain from lowering the Monetary Policy Rate. We wouldn't rule out the possibility that the CBN would regularise things by lowering the MPR. After all, it has eased its policy stance by allowing excess liquidity to build up in the money market. However, we remain unconvinced of much room for bond yields to fall further.

The case for Ugandan duration requires re-evaluation. The trade has not worked thus far, with yields backing up somewhat since we put it on. However, the currency remains solid.

However, there is an election coming up next year. Local investors might start to anticipate that the government will ramp up spending in the lead-up to those elections. Furthermore, the government has been falling behind in its revenue collection targets. All this points to the possibility that yields might remain elevated, if not rise some more.

Truthfully, these dynamics would make the trade even more appealing. In addition to yields potentially rising, there is also a possibility that USD/UGX might also rise somewhat in coming months. Before previous elections we have witnessed plenty of conjecture about a potential boost to import demand that leads to a depreciation of the UGX. But such depreciation tends to peter out, sometimes as much as 6-m before the election. Therein lies our quandary. Do we get out now and re-enter the trade at potentially higher yields and exchange rate in Q3:20, or do we hold on through the possible turbulence in the intervening period?

Our KES duration trade worked out pretty much as we anticipated. The currency appreciated slightly, and yields fell. As Q1:20 progresses, it will be worth considering if this would be the right time to take profit on the trade.

To be clear, the CBK's MPC is more likely to cut than raise interest rates. Inflation is on its way down, and after the repeal of the rate cap, credit growth is continuing to accelerate modestly. Even though the trajectory for USD/KES might reverse in Q2:20, in large part due to a ramp-up in demand from multinational companies for dividend payments, the MPC is unlikely to be unduly concerned by this.

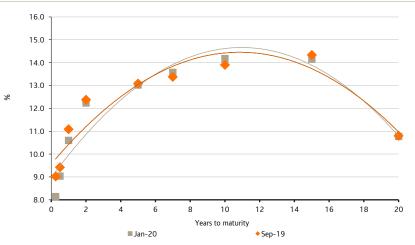

Figure 8: AF10 yield curve simple yield average

January 2020

Despite irksome fiscal policy management, we have retained our exposure to Zambian duration. Yields are quite elevated, having been in excess of 20% in the primary auction since the end of Dec 18. In fact, BOZ data indicates that the average bond yield rate in the 2-y to Dec 18 was about 19.3%.

Such high bond yields are bound to affect fiscal policy in a fundamental way. There is a strong likelihood that interest expenditure will absorb an ever-rising proportion of revenues, and account for a bigger share of total spending. Barring a fiscal adjustment this scenario could undermine overall macroeconomic stability.

This might be the year that the government finally delivers on the fiscal consolidation to which it has committed itself. We acknowledge, though, that the various shocks to have hit the economy, particularly the drought, could make fiscal consolidation hard to effect.

We have held a GHS bond position since late 2016. At the time, it seemed reasonable to believe that an improving BOP and ongoing disinflation would slow the pace of depreciation of the GHS while also leading to lower government bond yields.

The currency drag on this trade has been far too high. But, interestingly, it has not been consistent. The annual pace of depreciation was 13.1% in 2019, 8.4% and 8.8% in 2018 and 2017 respectively, 9.1% in 2016 and 13.9% in 2015. It still seems reasonable to expect that the GHS will settle into a single-digit pace of depreciation in the medium term. So, perhaps last year's rather fast pace of depreciation, in a preelection year, is similar to 2015, and will be followed by less depreciation in subsequent years. So, we will keep this position.

African Eurobonds: further yield compression, but with volatility

Since the Sep 19 edition of this report, African Eurobond spreads compressed. The spread over US Treasuries for our SBAFSOZ index – comprising all the USD Eurobonds issued by African governments, except South Africa – dropped to around 500 bps at the time of writing, from about 535 bps at the time of writing the Sep edition.

Even though African Eurobonds outperformed the broader EM in the past 4-m or so, as measured by the EMBI Global Index, EMBI spreads tightened by more. Such tightness of EM spreads, naturally, is a reason for some caution regarding African Eurobonds. EM spreads are lower than they were at the beginning of 2018, before the sell-off that ensued in the early part of that year. But, in the short term, the more subdued risk sentiment is, the more likely it is that the spread compression will continue.

Another reason for caution is impending issuance. Ghana has announced plans to issue up to USD3.0bn in Feb. We wouldn't rule out other issuers over the course of this year. Perhaps Angola, Kenya, Egypt and Nigeria are candidates. Admittedly, the timing for some of these might be in H2:20 rather than H1:20.

We have not changed the composition of our portfolio much since deciding to increase our exposure to long duration bonds some 4-m ago. At that time the spread between longer duration bonds and shorter duration bonds was close to historical highs. For instance, the spread between the Egypt '47s and '23s was nearly 2 standard deviations away from the mean. Similarly, the spread between the Senegal '48s and '21s was nearly 1.9 standard deviations away from the mean. As we anticipated then, the spread is compressing.

Observing that the tensions between the US and China were thawing, we tactically increased our exposure to oil sovereigns, specifically Angola and Nigeria. We are happy to retain this exposure.

Egypt and Senegal are our core overweight positions. The Egyptian government's determination to arrest the debt will likely succeed given that it is targeting a primary surplus of 2% of GDP, perhaps sustaining that in the coming 3-5 years. Economic growth is solid, above 5.0% y/y on a multi-year basis, something that is likely to underpin revenue growth as well. Credit rating upgrades in the next 2-y are very likely.

Hedging CNY exposure

Trade consummated between Africa and China is still predominantly conducted in USD. Standard Bank offers forwards that allow African importers to hedge CNY exposure.

Tanzania: public investment still supporting growth

GDP growth: benefits from public sector

We forecast GDP to grow by 7.0% y/y in both 2020 and 2021. We retain our 6.8% y/y forecast for 2019. The IMF forecasts of Oct 19 however see GDP expanding by 5.2% y/y in 2019 and then rising to 5.7% y/y in 2020.

We would be very surprised at growth of sub-6.0% y/y in 2019 because GDP grew by an average of 6.9% y/y in H1:19 and the agricultural sector likely recovered in H2:19.

Also, heavy rainfall in Q4:19 would support agricultural productivity in 2020 but may have been detrimental in Q4:19 due to floods disrupting trade and transport.

Net exports could also benefit over the next few years, underpinned by higher production from local gold mines, while service exports from both tourism and transport will probably also remain robust over this period.

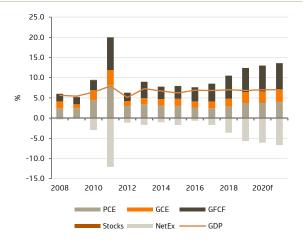

However, one cannot rule out travel advisories being issued by foreign governments, which could subsequently weigh on tourism given that 2020 is an election year and sporadic riots are likely. Nevertheless, the government would still want to boost capital expenditure over the medium term, specifically in 2020, but even beyond as they aim to rehabilitate infrastructure in aid of industrialization.

Indeed, the government's ability to boost expenditure on infrastructure projects may be a function of their success in securing external funding. Indeed, following the amendment of the National Statistics Act in H2:19, which now permits commentary on economic statistics, multilateral partners may be more willing to extend funding.

Nevertheless, disbursements for budget and or project support may be withheld over the coming year should both multilateral and bilateral donors view the political opposition as being treated unfairly ahead of the elections. Should the autonomy of the media be violated too, donors may well withhold support.

Arrears owed to the private sector remain above 2.0% of GDP. In fact, arrears tend to increase further as elections approach given that the government usually hurries projects despite funding deficiencies. If so, private consumption could remain subdued for longer.

Political risks: intensifying in an election year

The ruling party Chama Cha Mapinduzi (CCM) gained a landslide victory in the local elections in Nov 19. These polls were marred by controversy after Chadema, the main opposition party, opted to boycott the local elections amidst alleged allegations of government manipulation.

Interestingly, these local polls perhaps could have set the tone for the 2020 general elections in Oct. President Magufuli is likely to run again, and many would view him as the favourite.

However, the international community will perhaps choose to focus on the impartiality of the elections rather than on whom might emerge victorious.

External funding over the coming year for budget and project support will be contingent on how donors perceive the political climate. Should the media be muzzled, external funding for critical infrastructure projects may well be withheld.

Even then, concerns are rife that some of the positive reforms that the government has undertaken recently in sectors such as agriculture, where previous protectionist stances were suspended, may be transitory, considering that elections are around the corner and the government would aim to attract the votes of the large farming bloc.

Moreover, in addition to showcasing their rail, road and airport infrastructure projects, the ruling party will likely display their track record in clamping down on corruption as they look to regain control in the Oct 20 elections.

Election results (2015)							
Presidential election	Party votes	% of					
John Magufuli	CCM	58.46

Balance of payments: exports to pick up

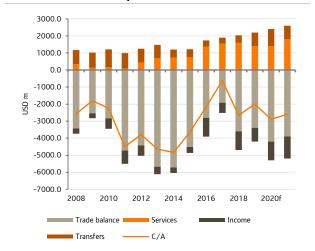

We now expect the C/A deficit to widen to 4.3% of GDP in 2020, from 6.3% previously. The government will likely boost capital expenditure in an election year. However, uncertainty in obtaining foreign funding for development projects, in addition to weak absorption, could see imports of goods increasing much slower than we previously anticipated.

Exports of goods and services rose to USD9,472.3m as at Nov 19, from USD8,588.6m in Nov 18. We see service receipts remaining robust, driven by the tourism and transport sectors. However, disruptions ahead of the Oct 20 elections could see tourism receipts wane. Still, the government's efforts in reforming the sector are notable, and are likely to persist over the next 2-y. Thus, despite the risk of travel advisories, we expect the tourism sector to improve further.

Moreover, despite risks to global growth abating and hence likely reducing international gold prices, higher domestic gold production will likely make up for this, considering that new gold mines are set to increase output over the coming years. Gold exports will probably continue to grow over the next 2-y.

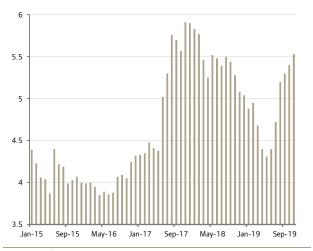

We see the C/A deficit narrowing to 3.5% of GDP in 2021 as the government will probably look to scale back pre-election expenditure. Furthermore, as the government has recently opted not to adopt protectionist measures in the cashew sector, we see earnings from this traditional export rising over the medium term. Also, consumer imports have remained relatively stagnant over the past year, likely to be the case again in 2020 as well due to arrears owed to the private sectors probably rising ahead of elections which of course may not embolden commercial banks to extend credit to the private sector too.

Current account developments

Source: Bank of Tanzania: Standard Bank Research

FX reserves (USD bn)

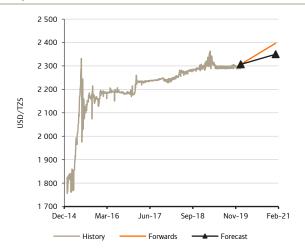

Source: Bank of Tanzania

FX outlook: gradual weakness

We see USD/TZS trading at 2350 to 2400 at end 2020 and 2021 respectively. However, in Q1:20 the pair is likely to drift above this. Firms looking to repatriate dividends typically increase their USD demand in Q1. During this period of cyclical pressure on the TZS, the BOT looks to minimize volatility in USD/TZS via selling USD to the market. As TZS liquidity conditions tighten, the pair tends to stabilize before the end of Q1. Thereafter, export earnings associated mainly with the agrarian sector increase between Apr and Sep, which creates a downside bias for USD/TZS then.

Still, corporates may be wary of political risks closer to elections and hence may opt to frontload their USD requirements well in advance. Nevertheless, weak consumer imports due to slower commerce closer to elections and higher cashew nut export earnings will probably help to stabilize the TZS in H2:20.

USD/TZS: forwards versus forecasts

Monetary policy: accommodative bias stays

We expect an accommodative bias to persist over the next 2-y, with the MPC likely to continue focusing on boosting private sector credit (PSC) growth.

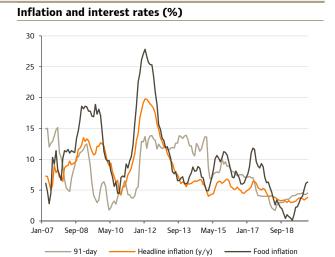

PSC growth recovered by 9.8% y/y in Oct 19, from an average of 4.1% y/y in Q1:19 and 2.0% y/y in H1:18. However, PSC growth remains quite modest compared to historical trends; it expanded by an average of 25.9% y/y and 16.2% y/y in 2011 and 2016 respectively.

In fact, commercial banks may turn more wary of asset quality closer to elections in Oct 20 and of course this concern could be compounded further if arrears owed to the private sector increased over the coming election year, which could halt the recent recovery in PSC growth and encourage the MPC to ease further.

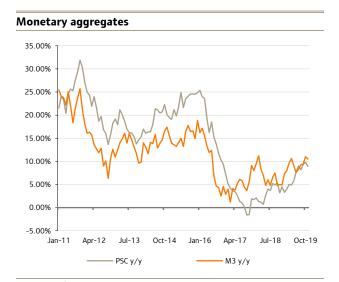

The MPC could therefore cut its discount rate by 50 bps in H2:20 and by a further 50 bps in H2:21. Despite the likelihood that political risks may perhaps be more elevated in H2:20, the TZS will probably remain stable during this period owing to seasonal agricultural inflows, while the partially liberalized nature of the capital account may also limit capital flight.

Barring sporadic spikes in international oil prices putting upward pressure on domestic fuel prices, we do not anticipate notable food shortages driving up headline inflation over the next 2-y.

We see headline inflation averaging 4.1% y/y in H1:20 and then 4.6% y/y in H2:20. Thereafter, averaging 4.5% y/y in 2021. More importantly, over the next 2-y, we don't expect core inflation to breach the 5.0% medium-term target level, as the economy will still show signs of spare capacity.

Source: Bank of Tanzania; National Bureau of Statistics

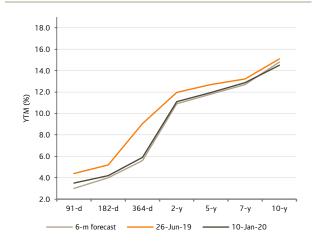

Source: Bank of Tanzania

Yield curve outlook: further bear-flattening

The government favoured higher yields on the longer end of the curve in Q4:19, which we expect to continue over the coming year due to the lengthening of the maturity profile of local government debt. Due to the cyclical TZS weakness that typically transpires, we would expect the yield curve to bear-flatten in Q1:20. Thereafter, as the exchange rate finds some stability, the yield curve is likely to bull-steepen from Apr 20.

However, the risk to this outlook is primarily linked to the government potentially being forced to borrow more from the domestic market in an election year, specifically should external funds prove challenging to source. In any case, the accommodative monetary policy stance we envisage from H2:20 is likely to create a downside bias for short-term yields, especially if this is also supplemented by a further cut in the Statutory Minimum Reserve (SMR) ratio too.

Changes in the yield curve

Source: Bank of Tanzania; Standard Bank Research

Fiscal policy: foreseen as expansionary

We expect the government to adopt an expansionary fiscal policy stance over the coming year. Public investment in infrastructure is likely to increase expenditure.

Scant data around public finance management makes it difficult to assess whether budget absorption has improved from FY2018/19 when it was quite weak for the development budget. But the government seems keen to boost spending on infrastructure projects, not just ahead of the Oct elections but also in the medium term.

The construction of the Dar es Salaam-Morogoro-Dodoma Standard Gauge Railway (SGR) is ongoing. Furthermore, the government announced that it has agreed in principle with counterparts in Rwanda to construct an SGR between the two countries that will be established from a dry port in Isaka, Tanzania.

We reiterate that, even as the government still struggles to source external funding from multilateral and bilateral partners, they may opt to issue more commercial debt such as syndicated loans similar to H2:19. We suspect this still may be the case over the next few years. Thus, the composition of non-concessional commercial external debt is likely to increase on government books.

On a positive note, though, the government is carefully assessing new infrastructure projects before contracting external debt. Recently, negotiations with the Chinese government stalled over the proposed construction of the Bagamoyo port after the government questioned the one-sided nature of the contractual agreement.

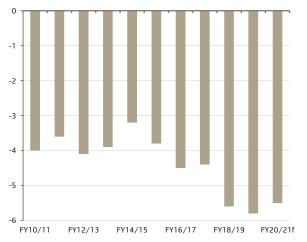

However, the risk of arrears increasing in an election year is always a possibility. If so, private sector activity could remain subdued for longer, and thus reduce revenue collections.

Centra	l government	budget,	% of	GDP
--------	--------------	---------	------	-----

	FY2018/19	FY2019/20

Net external borrowing	1.1	1.6
Donor support (grants)	3.6	3.5

Source: Ministry of Finance

Fiscal deficit excluding grants (% of GDP)

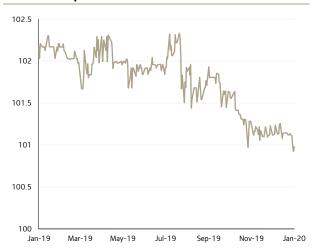

Source: Ministry of Finance

Eurobond outlook: neutral

The USD loan will mature in Mar 20. We expect the government to continue looking to source other external commercial debt such as syndicated loans over the next few years rather than issue an inaugural Eurobond. That said, the government would always prefer to issue concessional debt from multilateral lenders.

However, due to the stringent conditions often attached to such arrangements, they may seek out other alternative avenues to boost infrastructure spending. Furthermore, as political risks rise in 2020, it's hard to see the government doing enough to appease concessional lenders to be able to secure external loans on favourable terms from them. Thus, either critical infrastructure spending turns out to be the sacrificial lamb, or the government borrows more expensive and short-term external commercial debt.

XOF	West African Franc
у/у	Year on year, in reference to a rate of change

Yield	The return on an investment, usually expressed as a percentage over a period of time, usually a year.
YTD	Year to date
ZAR	South African Rand
ZMW	Zambian Kwacha

Protection of Personal Information Consent

Standard Bank Group, its subsidiaries and associate business units (including Standard Bank Research) have committed to treat the personal information that it collects as private and confidential and has published a comprehensive privacy statement accessible on this link. Should you wish to withdraw your consent to the processing of your personal information kindly email ResearchCompliance@standardbank.co.za

Client:means, for the purpose of this section, any natural or juristic person acting through their duly authorise representative(s), who has subscribed to or consented to being subscribed to

receiving research Services

Personal Information: means information relating to an identifiable, natural or juristic person, including information

relating to race, gender, sex, marital status, nationality, ethnic or social origin, colour, sexual orientation, age, physical or mental health, religion, belief, disability, language, birth, education, identity number, telephone number, email, postal or street address, biometric information and financial, criminal or employment history as well as correspondence sent by the person that is implicitly or explicitly of a private or confidential nature or further

correspondence that would reveal the contents of the original correspondence.

Process:means any operation or activity, whether automated or not, concerning Personal Information, including collection, receipt, recording, organisation, collation, storage, updating,

modification, retrieval, alteration, consultation, use, dissemination (whether by means of transmission, distribution or making available in any form), merging, linking, blocking,

degradation, erasure or destruction

Research Reports: means investment research reports, in relation to the Services, prepared by an independent

research analyst, non-independent research analyst or strategist who is part of an investment research team in a stock brokerage, global markets desk or corporate and investment bank

environment.

Services: means, *inter alia*, the provision of the Research Reports and other communications and

events with respect to equities, market strategy, companies, industries, commodities and countries and associated sales and trading commentary by Standard Bank Research ("SBR")

CONSENT FOR PROCESSING PERSONAL INFORMATION

1.1 The Client acknowledges that:

- **1.1.1** Applicable laws may at times require SBR to collect the Client's Personal Information;
- **1.1.2** Personal Information may be collected from public sources;
- 1.1.3 SBR may be unable to fulfil its regulatory obligations and provide Services to the Client without Processing the Client's Personal Information;
- 1.1.4 All Personal Information which the Client provides to SBR is voluntarily provided;
- 1.1.5 SBR shall determine the Services and means of Processing any Personal Information that is provided by the Client;
- **1.1.6** Personal Information may be processed by SBR and/ or, The Standard Bank of South Africa Limited and/or its associated entities or duly authorised third party service providers.
- **1.1.7** The Client consents to SBR processing its Personal Information in order to:
- **1.1.7.1** create and administer the Client's profile as contemplated by regulation;
- **1.1.7.2** carry out statistical and other analysis to identify potential markets and trends;
- **1.1.7.3** develop new products and services; and/or
- **1.1.7.4** any other purpose SBR reasonably believe is required to fulfil its obligations in accordance with regulation or this agreement.
- **1.1.8** The Client has consented to the Processing of its Personal Information for the purpose of clause 1. 7 above.
- 1.1.9 The Client hereby expressly consents that SBR may disclose to or share its Personal Information with duly authorised third parties, which may be located in the Republic of South Africa or other jurisdictions, where it is necessary in order for SBR to fulfil its obligations in accordance with the regulation and/or this agreement.
- **1.1.10** SBR will require any third-party service providers to whom the Client's Personal Information is provided to agree to SBR' data privacy principles policy and practices in accordance with the prevailing regulations including data privacy laws.

This material is non-independent research. Non-independent research is a "marketing communication"

This material is "non-independent research". Non-independent research is a "marketing communication" as defined in the UK FCA Handbook. It has not been prepared in accordance with the full legal requirements designed to promote independence of research and is not subject to any prohibition on dealing ahead of the dissemination of investment research.

Additional information with respect to any security referred to herein may be made available on request. This material is for the general information of institutional and market professionals' clients of Standard Bank Group (SBG) only. Recipients who are not market professionals or institutional investor customers of SBG should seek advice of their independent financial advisor prior to taking any investment decision based on this communication or for any necessary explanation of its content. It does not take into account the particular investment objectives, financial situation or needs of individual clients. Before acting on any advice or recommendations in this material, clients should consider whether it is suitable for their particular circumstances and, if necessary, seek professional advice. The information, tools and material presented in this marketing communication are provided to you for information purposes only and are not to be used or considered as an offer or the solicitation of an offer to sell or to buy or subscribe for securities or other financial instruments, nor shall it, or the fact of its distribution, form the basis of, or be relied upon in connection with, any contract relating to such action. This material is based on information that we consider reliable, but SBG does not warrant or represent (expressly or impliedly) that it is accurate, complete, not misleading or as to its fitness for the purpose intended and it should not be relied upon as such. The information and opinions contained in this document were produced by SBG as per the date stated and may be subject to change without prior notification Opinions expressed are our current opinions as of the date appearing on this material only. We endeavour to update the material in this report on a timely basis, but regulatory compliance or other reasons may prevent us from doing so.

SBG or its employees may from time to time have long or short positions in securities, warrants, futures, options, derivatives or other financial instruments referred to in this material. Where SBG designates NON- INDEPENDENT Research to be a "marketing communication", that term is used in SBG's Research Policy. This policy is available from the Research Compliance Office at SBG. SBG does and seeks to do business with companies covered in its non-independent research reports including Marketing Communications. As a result, investors should be aware that the Firm may have a conflict of interest that could affect the objectivity of this report. Investors should consider this report as only a single factor in making their investment decision.

SBG has published a Conflicts of Interest Policy that is available upon request which describes the organisational and administrative arrangements for the prevention and avoidance of conflicts of interest. Further disclosures required under the FCA Conduct of Business Sourcebook and other regulatory bodies are available on request from the Research Compliance Department and or Global Conflicts Control Room, unless otherwise stated, share prices provided within this material are as at the close of business on the day prior to the date of the material. None of the material, nor its content, nor any copy of it, may be altered in any way, transmitted to, copied or distributed to any other party, without the prior express written permission of SBG. All trademarks, service marks and logos used in this report are trademarks or service marks or registered trademarks or service marks of SBG or its affiliates.

SBG believes the information and opinions in the Disclosure Appendix of this report are accurate and complete. Information and opinions presented in the other sections of this communication were obtained or derived from sources SBG believes are reliable, but SBG makes no representations as to their accuracy or completeness. Additional information is available upon request. SBG accepts no liability for loss arising from the use of the material presented in this report, except that this exclusion of liability does not apply to the extent that liability arises under specific statutes or regulations applicable to SBG.

The services, securities and investments discussed in this material may not be available to nor suitable for all investors. Investors should make their own investment decisions based upon their own financial objectives and financial resources and it should be noted that investment involves risk, including the risk of capital loss. Past performance is no guide to future performance. In relation to securities denominated in foreign currency, movements in exchange rates will have an effect on the value, either favourable or unfavourable. Some investments discussed in this marketing communication have a high level of volatility. High volatility investments may experience sudden and large falls in their value causing losses when that investment is realised. Those losses may equal your original investment. Indeed, in the case of some investments the potential losses may exceed the amount of initial investment, in such circumstances you may be required to pay more money to support those losses. Income yields from investments may fluctuate and, in consequence, initial capital paid to make them investment may be used as part of that income yield. Some investments may not be readily realisable and it may be difficult to sell or realize those investments, similarly it may prove difficult for you to obtain reliable information about the value, or risks, to which such an investment is exposed.

This report is issued and distributed in Europe by Standard Advisory London Limited 20 Gresham Street, London EC2V 7JE which is authorised by the Financial Conduct Authority ("FCA").
